Vision In Action:

Visual Navigation Yiannis Aloimonos, 2013-05-13 All biological systems with vision move about their environments and successfully perform many tasks. The same capabilities are needed in the world of robots. To that end, recent results in empirical fields that study insects and primates as well as in theoretical and applied disciplines that design robots have uncovered a number of the principles of navigation. To offer a unifying approach to the situation, this book brings together ideas from zoology, psychology, neurobiology, mathematics, geometry, computer science, and engineering. It contains theoretical developments that will be essential in future research on the topic, especially new representations of space with less complexity than Euclidean representations possess. These representations allow biological and artificial systems to compute from images in order to successfully deal with their environments. In this book, the barriers between different disciplines have been smoothed, and the workings of vision systems of biological organisms are made clear in computational terms to computer scientists and engineers. At the same time, fundamental principles arising from computational considerations are made clear both to empirical scientists and engineers. Empiricists can generate a number of hypotheses that they could then study through various experiments. Engineers can gain insight for designing robotic systems that perceive aspects of their environment. For the first time, readers will find the insect vision system presented in a way that can be understood by computational scientists working in computer vision and engineering. Three complete working robotic navigation systems are presented with all the issues related to their design analyzed in detail. The beginning of a computational theory of direct perception as advocated by Gibson is presented in detail with applications for a variety of problems, and the idea that vision systems could compute space representations different from perfect metric descriptions and be used in robotic tasks advanced for both artificial and biological systems.

Planning and Urban Design Standards American Planning Association, Frederick R. Steiner, Kent Butler, 2012-09-17 The new student edition of the definitive reference on urban planning and design. *Planning and Urban Design Standards Student Edition* is the authoritative and reliable volume designed to teach students best practices and guidelines for urban planning and design. Edited from the main volume to meet the serious student's needs, this Student Edition is packed with more than 1,400 informative illustrations and includes the latest rules of thumb for designing and evaluating any land use scheme, from street plantings to new subdivisions. Students find real help understanding all the practical information on the physical aspects of planning and urban design they are required to know, including: Plans and plan making, Environmental planning and management, Building types, Transportation, Utilities, Parks and open space, farming and forestry, Places and districts, Design considerations, Projections and demand analysis, Impact assessment, Mapping, Legal foundations, Growth management, preservation, conservation, and reuse, Economic and real estate development. *Planning and Urban Design Standards Student Edition* provides essential specification and detailing information for various types of plans, environmental factors, and hazards, building types, transportation planning, and mapping.

and GIS In addition expert advice guides readers on practical and graphical skills such as mapping plan types and transportation planning

Visual Reflections Michael McCloskey,2009-04-30 How much can we learn about normal visual perception and cognition from a malfunctioning visual system Quite a lot as Michael McCloskey makes abundantly clear in this book McCloskey presents his work with AH a college student who has an extraordinary deficit in visual perception When AH looks at an object she sees it clearly and identifies it readily yet she is often dramatically mistaken about where the object is or how it is oriented For example she may reach out to grasp an object that she sees on her left but miss it completely because it is actually on her right or she may see an arrow pointing up when it is really pointing down AH s errors together with many other clues lead McCloskey to some very interesting conclusions about how we perceive the world He develops theoretical claims about visual subsystems the nature of visual location and orientation representations attention and spatial representations the role of the visual system in mental imagery and the levels of the visual system implicated in awareness Visual Reflections makes a fascinating and compelling case that we can often learn more about a process when it goes awry than when it functions flawlessly
