Abstract

Developmental delay occurs when developmental age is less than chronological age. Studies have shown that 1-3% of preschool children have global developmental delay and 10-15% of them have various forms of developmental delay [1]. Developmental delay may be mild, moderate, or severe, though early recognition and intervention are crucial to minimize the burden, prevent deterioration in other developmental domains, and optimize final prognosis. Although it is usually a multidisciplinary team task, pediatricians and frontline medical care staff hold the responsibility of spotting the case and planning the suitable intervention on time [2].

In this article we develop an easy approach for early recognition of all types of developmental delay during the first 6 years of age; suggesting clear and cost-effective guide of management plan. This approach is based on the recommendations of the world health organization (WHO) and major scientific bodies worldwide to avoid geographical variations.

Children worldwide seem to come across the same sequences of development within similar timetables. However, it is important to remember that each child is a unique human being [3]. There is enough information in pediatric books about developmental skills timetable in normal children of each age group. Nevertheless, recognition and management plan of developmental delay seems indirect, subjective with controversial issue. For this reason, Authorities and professional bodies in most countries started to implement clear plan to approach developmental delay cases with clear landmarks for early recognition and subsequent intervention in this vital age [4]. Neurological examination and developmental assessment are not the same; Neurological assessment is evalua-

tion of: cognitive function, alertness, orientation, memory, cranial nerves, balance, motor and sensory examinations. On the other hand, developmental assessment evaluates acquired skills fulfilled by history; different questionnaires and playful demonstrative maneuvers.

Normal Development is the result of maturation, physical growth, education, learning and environment effects [4]. Ataxia, hearing loss and dyspraxia are abnormal neurologic signs, for example, while inability to point to body parts, climbing stairs, building a tower of 3 bricks, or diminished response to social smile on time could be abnormal findings of developmental assessment.
