**Mathematics, Reading and Science Education** Linda M. Phillips, Stephen P. Norris, John S. Macnab, 2010-09-02 Science education at school level worldwide faces three perennial problems that have become more pressing of late. These are to a considerable extent interwoven with concerns about the entire school curriculum and its reception by students. The first problem is the increasing intellectual isolation of science from the other subjects in the school curriculum. Science is too often still taught didactically as a collection of pre-determined truths about which there can be no dispute. As a consequence many students do not feel any ownership of these ideas. Most other school subjects do somewhat better in these regards. For example in language classes students suggest different interpretations of a text and then debate the relative merits of the cases being put forward. Moreover ideas that are of use in science are presented to students elsewhere and then re-taught often using different terminology in science. For example algebra is taught in terms of  $x, y, z$  in mathematics classes but students are later unable to see the relevance of that to the meaning of the universal gas laws in physics where  $p, v, t$  are used. The result is that students are confused and too often alienated leading to their failure to achieve that extraction of an education from a scheme of instruction which Jerome Bruner thought so highly desirable. **Proceedings**, 2004

The twenty papers in the book give an overview of research analysis practical experience and informed opinion about the role of visualization in teaching and learning mathematics especially at the undergraduate level.
