Doevendans, 2006-04-11 The electrocardiogram ECG remains the most accessible and inexpensive diagnostic tool to evaluate the patient presenting with symptoms suggestive of acute myocardial ischemia It plays a crucial role in decision making about the aggressiveness of therapy especially in relation to reperfusion therapy because such therapy has resulted in a considerable reduction in mortality from acute myocardial infarction Several factors play a role in the amount of myocardial tissue that can be salvaged by reperfusion therapy such as the time interval between onset of coronary occlusion and reperfusion site and size of the jeopardized area type of reperfusion attempt thrombolytic agent or an intracoronary catheter intervention presence or absence of risk factors for thrombolytic agents etc Most important in decision making on reperfusion therapy and the type of intervention is to look for markers indicating a higher mortality rate from myocardial infarction The ECG is a reliable inexpensive non invasive instrument to obtain that information Recently it has become clear that both in anterior and inferior myocardial infarction the ECG frequently allows

not only to identify the infarct related coronary artery but also the site of occlusion in that artery and therefore the size of the jeopardized area Obviously the more proximal the occlusion the larger the area at risk and the more aggressive the reperfusion attempt *RICHARD FARRINGTON V TOTAL PETROLEUM, INC., 442 MICH 201 (1993) ,1993 91677*
