Unsteady Flame Marjorie Moore, 1937      Gasdynamics of Explosions and Reactive Systems A. K. Oppenheim, 2013-10-22  
Gas Dynamics of Explosions and Reactive Systems documents the proceedings of the 6th Colloquium held at the Royal Institute of Technology in Stockholm Sweden 22-26 August 1977 The meeting was held under the auspices of the Royal Swedish Academy of Sciences and the International Academy of Astronautics The scientific program included over one hundred papers The contributions in this volume are organized into four parts Part I contains papers on gaseous detonations It covers topics such as theoretical model of a detonation cell spherical detonations in hydrocarbon air mixtures and shock wave propagation in tubes filled with water foams Part II presents studies on explosions such as the detonation of hydrogen azide and propagation of a laser supported detonation wave Part III examines condensed phase detonations It includes papers on the mechanism of the divergent and convergent dark waves originating at the charge boundary in detonating liquid homogeneous explosives with unstable detonation front and initiation studies in sensitized nitromethane Part IV presents discussions on turbulent detonations covering topics such as the computational aspects of turbulent combustion and problems and techniques in turbulent reactive systems      Dynamics of Gaseous Combustion A. L. Kuhl, 1993      **Turbulent Combustion Modeling** Tarek Echekki, Epaminondas Mastorakos, 2010-12-25 Turbulent combustion sits at the interface of two important nonlinear multiscale phenomena chemistry and turbulence Its study is extremely timely in view of the need to develop new combustion technologies in order to address challenges associated with climate change energy source uncertainty and air pollution Despite the fact that modeling of turbulent combustion is a subject that has been researched for a number of years its complexity implies that key issues are still eluding and a theoretical description that is accurate enough to make turbulent combustion models rigorous and quantitative for industrial use is still lacking In this book prominent experts review most of the available approaches in modeling turbulent combustion with particular focus on the exploding increase in computational resources that has allowed the simulation of increasingly detailed phenomena The relevant algorithms are presented the theoretical methods are explained and various application examples are given The book is intended for a relatively broad audience including seasoned researchers and graduate students in engineering applied mathematics and computational science engine designers and computational fluid dynamics CFD practitioners scientists at funding agencies and anyone wishing to understand the state of the art and the future directions of this scientifically challenging and practically important field      **Oxygen-Enhanced Combustion** Charles E.
