Temporal Disorder in Human Oscillatory Systems L. Rensing, U. An der Heiden, M. C. Mackey, 1987 *Temporal Disorder in Human Oscillatory Systems* Ludger Rensing, Uwe an der Heiden, Michael C. Mackey, 1987-01-01 Rhythms of the heart and of the nervous and endocrine system breathing locomotory movements sleep circadian rhythms and tissue cell cycles are major elements of the temporal order of man The dynamics of these systems are characterized by changes in the properties of an oscillator transitions from oscillatory states into chaotic or stationary states and vice versa coupling or uncoupling between two or more oscillators Any deviation from the normal range to either more or less ordered states may be defined as temporal disorder Pathological changes of temporal organization such as tremor epileptic seizures Cheyne Stokes breathing cardiac arrhythmicities and circadian desynchronization may be caused by small changes in the order control parameters One major aspect of the symposium was the analysis of characteristic features of these temporal control systems including nonlinear dynamics of interactions positive negative and mixed feedback systems temporal delays and their mathematical description and modelling The ultimate goal is a better understanding of the principles of temporal organization in order to treat periodic diseases or other perturbations of normal dynamics in human oscillatory systems

Reid, 1990-12-11 Difficulties in motor behavior are commonly associated with a variety of disabilities Early research efforts focused on descriptions of specific groups of people or on evaluations of intervention programs Only recently have investigators begun to explore questions from a variety of theoretical positions in an attempt to build a more fundamental understanding of the disabled person The present volume represents views of major methodological issues current research fronts and selected applied concerns from the perspective of the disabled performer Authors write from a

number of theoretical viewpoints and sketch future research directions in these chapters

Brain Function and Oscillations Erol Başar, 2012-12-06 by W J Freeman These two volumes on Brain Oscillations appear at a most opportune time As the Decade of the Brain draws to its close brain science is coming to terms with its ultimate problem understanding the mechanisms by which the immense number of neurons in the human brain interact to produce the higher cognitive functions The ideas concepts methods interpretations and examples which are presented here in voluminous detail by a world class authority in electrophysiology summarize the intellectual equipment that will be required to construct satisfactory solutions to the problem Neuroscience is ripe for change The last revolution of ideas took place in the middle of the century now ending when the field took a sharp turn into a novel direction During the preceding five decades the prevailing view carried forward from the 19th century was that neurons are the carriers of nerve energy either in chemical or electrical forms Freeman 1995 That point of view was enormously productive in terms of coming to understand the chemical basis for synaptic transmission the electrochemistry of the action potential the ionic mechanisms of membrane currents and gates the functional neuroanatomy that underlies the hierarchy of reflexes and the neural fields and their resonances that support Gestalt phenomena No better testimony can be given of the power of the applications of this approach than to point out that it provides the scientific basis for contemporary neurology neuropsychiatry and brain imaging

Brunner, 2012-12-06 Self organization and clinical psychology signals the advent of a new paradigm in psychology Physicists neuroscientists and individual and grouptherapists have joined forces to elucidate the new and exciting advances that are being achieved by applying the concepts of non linear dynamics and self organization to the human nervous system and the mind

Self-organization in Optical Systems and Applications in Information Technology Mikhail Alekseevich Vorontsov, Walter Blaine Miller, 1995 Contrary to monographs on non linear optics this book concentrates on problems of self organization in various important contexts The reader learns how patterns in non linear optical systems are created and what theoretical methods can be applied to describe them Next various aspects of pattern formation such as associative memory information processing spatio temporal instability photo refraction and so on are treated The book addresses graduate students and researchers in physics and optical engineering
