

Understanding Diabetes

Glucose metabolism

Glucose is the main source of energy for the body's cells. It is transported from the liver to the cells through the bloodstream. In the cells, glucose is broken down into pyruvate, which is then used to produce energy. The liver also stores glucose as glycogen for later use.

Glucagon signals the liver to convert glycogen to glucose and release the glucose into the blood.

Function of insulin

Insulin is a hormone that allows glucose to enter the cells. It is produced by the beta cells of the pancreas. In people with diabetes, the pancreas does not produce enough insulin, or the body's cells do not respond properly to the insulin that is produced.

Action of insulin

Type 1

In Type 1 diabetes, the pancreas produces very little insulin. This means that glucose cannot enter the cells, and it builds up in the blood.

Type 2

In Type 2 diabetes, the body's cells do not respond properly to the insulin that is produced. This means that glucose cannot enter the cells, and it builds up in the blood.

Normal

The pancreas produces enough insulin, and the body's cells respond properly to it. This allows glucose to enter the cells and be used for energy.

Glucose

Glucose

Insulin stimulates cells to take up glucose

The beta cells of the pancreas convert it into glucose and store it.

What is diabetes?

Diabetes is a chronic condition that affects the way the body uses glucose. There are two main types: Type 1 and Type 2. In Type 1, the pancreas does not produce enough insulin. In Type 2, the body's cells do not respond properly to the insulin that is produced.

Glucose is converted to triglycerides and stored in the adipose tissue.

Cells use glucose as fuel.

- ### Symptoms of diabetes

 - Blurred vision
 - Slow-healing sores
 - Skin infections
 - Unexplained fatigue, weight loss, and mood changes

Health complications

Kidney damage

Diabetes can damage the kidneys, which filter waste from the blood. This is called kidney disease. It can lead to kidney failure, which may require dialysis or a kidney transplant.

Vision problems

Diabetes can damage the blood vessels in the eyes, leading to vision problems. This is called diabetic retinopathy. It can lead to blindness if not treated.

Heart disease

Diabetes increases the risk of heart disease, including heart attack and stroke. This is because diabetes can damage the blood vessels and lead to the buildup of plaque.

Nerve damage

Diabetes can damage the nerves, leading to numbness, tingling, and pain. This is called diabetic neuropathy. It can also lead to foot ulcers and infections.

Treatment and healthy lifestyle changes

There are several ways to manage diabetes, including medication, diet, and exercise. For Type 1 diabetes, insulin is essential. For Type 2 diabetes, lifestyle changes and medication can help. It is important to work with a healthcare provider to develop a personalized treatment plan.
