Vlsi Circuit Simulation And Optimisation:

VLSI Circuit Simulation and Optimization V. Litovski, Mark Zwolinski, 1996-12-31 Circuit simulation has become an essential tool in circuit design and without its aid analogue and mixed signal IC design would be impossible. However, the applicability and limitations of circuit simulators have not been generally well understood and this book now provides a clear and easy to follow explanation of their function. The material covered includes the algorithms used in circuit simulation and the numerical techniques needed for linear and non linear DC analysis, transient analysis and AC analysis. The book goes on to explain the numeric methods to include sensitivity and tolerance analysis and optimisation of component values for circuit design. The final part deals with logic simulation and mixed signal simulation algorithms. There are comprehensive and detailed descriptions of the numerical methods and the material is presented in a way that provides for the needs of both experienced engineers who wish to extend their knowledge of current tools and techniques and of advanced students and researchers who wish to develop new simulators. Simulation and Optimization of Digital Circuits Vazgen

Melikyan, 2018-04-12 This book describes new fuzzy logic based mathematical apparatus which enable readers to work with continuous variables while implementing whole circuit simulations with speed similar to gate level simulators and accuracy similar to circuit level simulators. The author demonstrates newly developed principles of digital integrated circuit simulation and optimization that take into consideration various external and internal destabilizing factors influencing the operation of digital ICs. The discussion includes factors including radiation, ambient temperature, electromagnetic fields and climatic conditions as well as non ideality of interconnects and power rails. **Parallel VLSI Circuit Analysis and Optimization**

Xiaoji Ye, 2012 The prevalence of multi core processors in recent years has introduced new opportunities and challenges to Electronic Design Automation (EDA) research and development. In this dissertation a few parallel Very Large Scale Integration (VLSI) circuit analysis and optimization methods which utilize the multi core computing platform to tackle some of the most difficult contemporary Computer Aided Design (CAD) problems are presented. The first CAD application that is addressed in this dissertation is analyzing and optimizing mesh based clock distribution network. Mesh based clock distribution network also known as clock mesh is used in high performance microprocessor designs as a reliable way of distributing clock signals to the entire chip. The second CAD application addressed in this dissertation is the Simulation Program with Integrated Circuit Emphasis (SPICE) like circuit simulation. SPICE simulation is often regarded as the bottleneck of the design flow. Recently parallel circuit simulation has attracted a lot of attention. The first part of the dissertation discusses circuit analysis techniques. First a combination of clock network specific model order reduction algorithm and a port sliding scheme is presented to tackle the challenges in analyzing large clock meshes with a large number of clock drivers. Our techniques run much faster than the standard SPICE simulation and existing model order reduction techniques. They also provide a basis for the clock mesh optimization. Then a hierarchical multi algorithm parallel circuit simulation HMAPS framework is presented.

as an novel technique of parallel circuit simulation The inter algorithm parallelism approach in HMAPS is completely different from the existing intra algorithm parallel circuit simulation techniques and achieves superlinear speedup in practice The second part of the dissertation talks about parallel circuit optimization A modified asynchronous parallel pattern search APPS based method which utilizes the efficient clock mesh simulation techniques for the clock driver size optimization problem is presented Our modified APPS method runs much faster than a continuous optimization method and effectively reduces the clock skew for all test circuits The third part of the dissertation describes parallel performance modeling and optimization of the HMAPS framework The performance models and runtime optimization scheme improve the speed of HMAPS further more The dynamically adapted HMAPS becomes a complete solution for parallel circuit simulation
