abstract Voice over IP VoIP is at the moment one of the most discussed topics in the current network scene Besides the  
theoretical interest in network development there is always the practical relevance which is of high importance for advances  
in network technology One major proof that VoIP research and its technology has a high impact on businesses is the fact that  
VoIP it is already implemented in a number of companies in the United States of America UK Ireland and South Korea  
according to Cherry 2005 The following graphic shows the importance of VoIP for companies according to a recent

Technologies provides solid technical information on how to successfully design and implement a converged network  
combining voice data fax and video transmissions into a cohesive networking infrastructure centered on the Internet Protocol  
Converged networks which combine voice data fax and video transmissions into a cohesive networking infrastructure all  
centered on the Internet Protocol or IP promise a number of advantages over existing separate networking environments But  
to successfully design and implement a converged network requires expertise on both the voice and data networking sides of  
the house Unfortunately few individuals have these credentials either you are a voice networking expert and familiar with  
circuit switching and connections between PBXs or you are a data networking expert familiar with packet switching and  
connections between routers and servers The objective of this text is to bridge the gap between the voice and data  
networking sides and provide the reader with the opportunity to fill in their areas of weakness with solid technical

information In addition this text presents a number of case studies from architectural financial and technical perspectives that illustrate real world applications for these technologies
