The Syntactic Process Mark Steedman, 2001-07-27 This book covers topics in formal linguistics intonational phonology computational linguistics and experimental psycholinguistics presenting them as an integrated theory of the language faculty In this book Mark Steedman argues that the surface syntax of natural languages maps spoken and written forms directly to a compositional semantic representation that includes predicate argument structure quantification and information structure without constructing any intervening structural representation His purpose is to construct a principled theory of natural grammar that is directly compatible with both explanatory linguistic accounts of a number of problematic syntactic phenomena and a straightforward computational account of the way sentences are mapped onto representations of meaning The radical nature of Steedman's proposal stems from his claim that much of the apparent complexity of syntax prosody and processing follows from the lexical specification of the grammar and from the involvement of a small number of universal rule types for combining predicates and arguments These syntactic operations are related to the combinators of Combinatory Logic engendering a much freer definition of derivational constituency than is traditionally assumed This property allows Combinatory Categorical Grammar to capture elegantly the structure and interpretation of coordination and intonation contour in English as well as some well known interactions between word order coordination and relativization across a number of other languages It also allows more direct compatibility with incremental semantic interpretation during parsing The book covers topics in formal linguistics intonational phonology computational linguistics and experimental psycholinguistics presenting them as an integrated theory of the language faculty in a form accessible to readers from any of those fields

**American Anthropologist**, 1911 **The relationship between music and language** Lutz Jäncke, Traditionally music and language have been treated as different psychological faculties This duality is reflected in older theories about the lateralization of speech and music in that speech functions were thought to be localized on the left and music functions on

the right hemisphere But with the advent of modern brain imaging techniques and the improvement of neurophysiological measures to investigate brain functions an entirely new view on the neural and psychological underpinnings of music and speech has evolved The main point of convergence in the findings of these new studies is that music and speech functions have many aspects in common and that several neural modules are similarly involved in speech and music There is also emerging evidence that speech functions can benefit from music functions and vice versa This new research field has accumulated a lot of new information and it is therefore timely to bring together the work of those researchers who have been most visible productive and inspiring in this field and to ask them to present their new work or provide a summary of their laboratory s work
