RSA CRYPTOSYSTEM KEY GENERATION, ENCRYPTION, DECRYPTION, AND DIGITAL SIGNATURES: LEARN BY EXAMPLES WITH PYTHON AND TKINTER Vivian Siahaan, Rismon Hasiholan Sianipar, 2024-08-28

Unlock the secrets of modern cryptography explored in this book a comprehensive guide that takes you from the fundamentals to advanced applications in encryption decryption and digital signatures Whether you re a beginner or an experienced developer this book offers hands on examples real world scenarios and detailed explanations that make complex concepts accessible and engaging Dive into the world of RSA as you learn to build secure systems and protect sensitive information with confidence Perfect for anyone looking to master the art of cryptography this book is your key to the future of digital security

In chapter one we implemented RSA key generation within a Tkinter based GUI application This example was designed to be user friendly allowing users to generate RSA keys with a simple button click The process involved generating a private key and a corresponding public key which were then displayed within a text widget for easy copying and saving This example demonstrated the ease with which RSA keys can be generated programmatically making cryptography more accessible to users who may not be familiar with command line interfaces

In chapter two we embarked on a journey to create a sophisticated RSA encryption and decryption project We began by constructing a comprehensive Tkinter based GUI application that allows users to generate RSA key pairs create and sign transactions verify signatures and securely store transactions The initial focus was on setting up the graphical user interface with multiple tabs dedicated to different functionalities ensuring that the application was both user friendly and feature rich The core functionality of the application revolves around RSA key generation transaction creation and digital signing The RSA keys are generated using the cryptography library and users can generate private and public keys which are then displayed in the application This setup forms the foundation for securely signing transactions The transaction creation process involves entering details like the sender receiver amount and currency after which the transaction data is signed using the private key producing a digital signature This digital signature ensures the authenticity and integrity of the transaction preventing any tampering or forgery Once transactions are signed they can be stored in a secure manner The application allows users to save these transactions along with their digital signatures in a JSON file providing a permanent and verifiable record This storage mechanism is crucial for maintaining the integrity of financial transactions or any sensitive data as it ensures that each transaction is accompanied by a corresponding signature and public key enabling later verification The verification process is another key component of the project The application retrieves stored transactions and verifies the digital signature against the stored public key This process ensures that the transaction has not been altered since it was signed confirming its authenticity The verification feature is critical in real world applications where data integrity and authenticity are paramount such as in financial systems legal documents or secure communications Throughout the chapter the project was designed with a strong emphasis on real world applicability robustness and security The example

provided not only serves as a practical guide for implementing RSA encryption and decryption with digital signatures but also highlights the importance of secure key management transaction integrity and data authenticity in modern cryptographic applications This project demonstrates the power of RSA in securing sensitive data and transactions in a user friendly and accessible way making it an essential tool for developers working with encryption in real world scenarios In chapter three we some projects focused on RSA digital signatures delving into the creation of synthetic datasets key generation data signing and verification processes The project s primary objective is to demonstrate how RSA digital signatures can be applied in a real world scenario by securely signing and verifying user data This example uses a synthetic dataset of user information including user IDs names emails and registration dates to illustrate the practical implementation of RSA cryptography The project begins with generating RSA keys using the `generate_rsa_keys` function This function creates a pair of keys a private key used for signing data and a public key for verifying the signature These keys are essential for the RSA cryptographic process where the private key ensures that the data remains authentic and unaltered while the public key is used to verify the authenticity of the signed data The keys are serialized into PEM format a widely used encoding standard that facilitates the secure storage and transmission of cryptographic keys Next a synthetic user dataset is generated using the `create_synthetic_user_dataset` function This dataset comprises a specified number of user records each containing a unique user ID name email address and registration date The purpose of this synthetic data is to simulate a realistic environment where user information needs to be securely signed and verified By using a synthetic dataset we ensure that the example remains versatile and adaptable to various scenarios without relying on actual sensitive information Once the dataset is generated the `sign_data` function is employed to sign each user s data using the RSA private key This process involves creating a digital signature for each record ensuring that any alteration to the data after signing would invalidate the signature The digital signature serves as a cryptographic proof of the data s integrity and authenticity providing a robust mechanism to detect tampering or unauthorized modifications The signatures are then stored alongside the user data for subsequent verification Finally the project includes a mechanism for storing the signed data and public key in a JSON file and a function for retrieving and verifying the data The `store_user_data` function saves the user data corresponding signatures and the public key to a file allowing for secure storage and later retrieval The `retrieve_and_verify_user_data` function reads the stored data verifies each signature using the public key and confirms whether the data remains unaltered This final step completes the demonstration of how RSA digital signatures can be effectively used to secure user data making it a comprehensive example for those learning about cryptographic techniques in real world applications
