Variational Methods in Some Shape Optimization Problems Dorin Bucur, Giuseppe Buttazzo, 2002 Variational Methods in Shape Optimization Problems Dorin Bucur, Giuseppe Buttazzo, 2006-09-13 The fascinating field of shape optimization problems has received a lot of attention in recent years particularly in relation to a number of applications in physics and engineering that require a focus on shapes instead of parameters or functions The goal of these applications is to deform and modify the admissible shapes in order to comply with a given cost function that needs to be optimized In this respect the problems are both classical as the isoperimetric problem and the Newton problem of the ideal aerodynamical shape show and modern reflecting the many results obtained in the last few decades The intriguing feature is that the competing objects are shapes i.e. domains of \mathbb{R}^n instead of functions as it usually occurs in problems of the calculus of variations This constraint often produces additional difficulties that lead to a lack of existence of a solution and to the introduction of suitable relaxed formulations of the problem However in certain limited cases an optimal solution exists due to the special form of the cost functional and to the geometrical restrictions on the class of competing domains **Variational methods in some shape optimization problems** Dorin Bucur, Giuseppe Buttazzo, 2002-10-01 The study of shape optimization problems is a very wide field both classical as the isoperimetric problem and Newton problem of the best aerodynamical shape show and modern for all the recent results obtained in the last two three decades The fascinating feature is that the competing objects are shapes i.e. domains of \mathbb{R}^n instead of functions as usually occurs in problems of calculus of variations This constraint often produces additional difficulties that lead to a lack of existence of a solution and the introduction of suitable relaxed formulations of the problem However in a few cases an optimal solution exists due to the special form of the cost functional and to the geometrical restriction on the class of competing domains This volume collects the lecture notes of two courses given in the academic year 2000-01 by the authors at the University of Pisa and at the Scuola Normale Superiore respectively The courses were mainly addressed to Ph.D. students and required a background in the topics in functional analysis that are usually taught in undergraduate courses **Boundary Element Methods in Engineering** Balkrishna S. Annigeri, Kadin Tseng, 2012-12-06 The Boundary Element Method BEM has become established as an effective tool for the solutions of problems in engineering science The salient features of the BEM have been well documented in the open literature and therefore will not be elaborated here The BEM research has progressed rapidly especially in the past decade and continues to evolve worldwide This Symposium was organized to provide an international forum for presentation of current research in BEM for linear and nonlinear problems in solid and fluid mechanics and related areas To this end papers on the following topics were included rotary wing aerodynamics unsteady aerodynamics design and optimization elasticity elasto dynamics and elastoplasticity fracture mechanics acoustics diffusion and wave motion thermal analysis mathematical aspects and boundary finite element coupled methods A special session was devoted to parallel vector supercomputing with

emphasis on massive parallelism This Symposium was sponsored by United Technologies Research Center UTRC NASA Langley Research Center and the International Association of Boundary Element Methods IABEM We thank the UTRC management for their permission to host this Symposium In particular we thank Dr Arthur S Kesten and Mr Robert E Olson for their encouragement and support We gratefully acknowledge the support of Dr E Carson Yates Jr of NASA Langley Prof Luigi Morino Dr Thomas A

Optimal Design through the Sub-Relaxation Method Pablo Pedregal, 2016-09-01 This book provides a comprehensive guide to analyzing and solving optimal design problems in continuous media by means of the so called sub relaxation method Though the underlying ideas are borrowed from other more classical approaches here they are used and organized in a novel way yielding a distinct perspective on how to approach this kind of optimization problems Starting with a discussion of the background motivation the book broadly explains the sub relaxation method in general terms helping readers to grasp from the very beginning the driving idea and where the text is heading In addition to the analytical content of the method it examines practical issues like optimality and numerical approximation Though the primary focus is on the development of the method for the conductivity context the book's final two chapters explore several extensions of the method to other problems as well as formal proofs The text can be used for a graduate course in optimal design even if the method would require some familiarity with the main analytical issues associated with this type of problems This can be addressed with the help of the provided bibliography

Recent Advances in Partial Differential Equations and Applications Vicențiu D. Rădulescu, Adélia Sequeira, Vsevolod A. Solonnikov, 2016-06-28 This volume contains the proceedings of the International Conference on Recent Advances in PDEs and Applications in honor of Hugo Beirão da Veiga's 70th birthday held from February 17-21, 2014 in Levico Terme, Italy. The conference brought together leading experts and researchers in nonlinear partial differential equations to promote research and to stimulate interactions among the participants. The workshop program testified to the wide-ranging influence of Hugo Beirão da Veiga on the field of partial differential equations, in particular those related to fluid dynamics. In his own work, da Veiga has been a seminal influence in many important areas: Navier-Stokes equations, Stokes systems, non-Newtonian fluids, Euler equations, regularity of solutions, perturbation theory, vorticity phenomena, and nonlinear potential theory, as well as various degenerate or singular models in mathematical physics. This same breadth is reflected in the mathematical papers included in this volume.

Applications of the Topological Derivative Method Antonio André Novotny, Jan Sokołowski, Antoni Żochowski, 2018-12-28 The book presents new results and applications of the topological derivative method in control theory, topology optimization, and inverse problems. It also introduces the theory in singularly perturbed geometrical domains using selected examples. Recognized as a robust numerical technique in engineering applications such as topology optimization, inverse problems, imaging, processing, multi-scale material design, and mechanical modeling including damage and fracture evolution phenomena, the topological derivative method is based on the asymptotic approximations of solutions to elliptic boundary value problems combined with mathematical programming tools. The book presents the first-order topology design algorithm and its applications in topology optimization and introduces the second-order Newton-type reconstruction algorithm based on higher-order topological derivatives for solving inverse reconstruction problems. It is intended for researchers and students in applied mathematics and computational mechanics interested in the mathematical aspects of the topological derivative method as well as its applications in computational mechanics.
