**Three-Dimensional Machine Vision** Takeo Kanade, 2012-12-06      **Three-Dimensional Machine Vision** Takeo Kanade, 1987-03-31

A robot must perceive the three dimensional world if it is to be effective there. Yet recovering 3 D information from projected images is difficult and still remains the subject of basic research. Alternatively one can use sensors that can provide three dimensional range information directly. The technique of projecting light stripes started to be used in industrial object recognition systems as early as the 1970s and time of flight laser scanning range finders became available for outdoor mobile robot navigation in the mid eighties. Once range data are obtained a vision system must still describe the scene in terms of 3 D primitives such as edges surfaces and volumes and recognize objects of interest. Today the art of sensing extracting features and recognizing objects by means of three dimensional range data is one of the most exciting research areas in computer vision.

**Three Dimensional Machine Vision** is a collection of papers dealing with three dimensional range data. The authors are pioneering researchers some are founders and others are bringing new excitement in the field. I have tried to select milestone papers and my goal has been to make this book a reference work for researchers in three dimensional vision. The book is organized into four parts: 3 D Sensors, 3 D Feature Extractions, Object Recognition Algorithms and Systems, and Applications. Part I includes four papers which describe the development of unique capable 3 D range sensors as well as discussions of optical geometrical electronic and computational issues. Mundy and Porter describe a sensor system based on structured illumination for inspecting metallic castings. In order to achieve high speed data acquisition it uses multiple light stripes with wavelength multiplexing. Case, Jalkio and Kim also present a multi stripe system and discuss various design issues in range sensing by triangulation. The numerical stereo camera developed by Altschuler, Bae, Altschuler, Djak, Tamburino and Woolford projects space coded grid patterns which are generated by an electro optical programmable spatial light modulator. Kanade and Fuhrman present a proximity sensor using multiple LEDs which are conically arranged. It can measure both distance and orientation of an object's surface.

With the ongoing release of 3D movies and the emergence of 3D TVs 3D imaging technologies have penetrated our daily lives. Yet choosing from the numerous 3D vision methods available can be frustrating for scientists and engineers especially without a comprehensive resource to consult. Filling this gap *Handbook of 3D Machine Vision: Optical Metrology and Imaging* gives an extensive in depth look at the most popular 3D imaging techniques. It focuses on noninvasive noncontact optical methods: optical metrology and imaging. The handbook begins with the well studied method of stereo vision and explains how random speckle patterns or space time varying patterns substantially improve the results of stereo vision. It then discusses stereo particle image velocimetry as a major experimental means in fluid dynamics, the robust and easy to implement structured light technique for computer science applications, digital holography for performing micro

to nanoscale measurements and grating interferometry and fringe projection techniques for precisely measuring dynamically deformable natural objects The book goes on to describe techniques that do not require triangulation to recover a 3D shape including time of flight techniques and uniaxial 3D shape measurement as well as 3D measurement techniques that are not restricted to surface capture such as 3D ultrasound optical coherence tomography and 3D endoscopy The book also explores how novel 3D imaging techniques are being applied in the promising field of biometrics which may prove essential to security and public safety Written by key players in the field and inventors of important imaging technologies this authoritative state of the art handbook helps you understand the core of 3D imaging technology and choose the proper 3D imaging technique for your needs For each technique the book provides its mathematical foundations summarizes its successful applications and discusses its limitations

*Three-Dimensional Object Recognition Systems* A.K. Jain, B.Tech PhD,P.J. Flynn,1993-05-05 The design and construction of three dimensional 3 D object recognition systems has long occupied the attention of many computer vision researchers The variety of systems that have been developed for this task is evidence both of its strong appeal to researchers and its applicability to modern manufacturing industrial military and consumer environments 3 D object recognition is of interest to scientists and engineers in several different disciplines due to both a desire to endow computers with robust visual capabilities and the wide applications which would benefit from mature and robust vision systems However 3 D object recognition is a very complex problem and few systems have been developed for actual production use most existing systems have been developed for experimental use by researchers only This edited collection of papers summarizes the state of the art in 3 D object recognition using examples of existing 3 D systems developed by leading researchers in the field While most chapters describe a complete object recognition system chapters on biological vision sensing and early processing are also included The volume will serve as a valuable reference source for readers who are involved in implementing model based object recognition systems stimulating the cross fertilisation of ideas in the various domains The variety of topics on Image Communication is so broad that no one can be a specialist in all the topics and the whole area is beyond the scope of a single volume while the requirement of up to date information is ever increasing This new closed end book series is intended both

as a comprehensive reference for those already active in the area of Image Communication as well as providing newcomers with a foothold for commencing research Each volume will comprise a state of the art work on the editor s author s area of expertise containing information until now scattered in many journals and proceedings

Three-Dimensional Computer Vision Yoshiaki Shirai, 2012-12-06 The purpose of computer vision is to make computers capable of understanding environments from visual information Computer vision has been an interesting theme in the field of artificial intelligence It involves a variety of intelligent information processing both pattern processing for extraction of meaningful symbols from visual information and symbol processing for determining what the symbols represent The term 3D computer vision is used if visual information has to be interpreted as three dimensional scenes 3D computer vision is more challenging because objects are seen from limited directions and some objects are occluded by others In 1980 the author wrote a book Computer Vision in Japanese to introduce an interesting new approach to visual information processing developed so far Since then computer vision has made remarkable progress various rangefinders have become available new methods have been developed to obtain 3D information knowledge representation frameworks have been proposed geometric models which were developed in CAD CAM have been used for computer vision and so on The progress in computer vision technology has made it possible to understand more complex 3 D scenes There is an increasing demand for 3D computer vision In factories for example automatic assembly and inspection can be realized with fewer constraints than conventional ones which employ two dimensional computer vision
