

# On Value Distribution Theory of Second Order Periodic ODEs, Special Functions and Orthogonal Polynomials

*Dedicated to the memory of Noel Baker, a dear friend.*

*Abstract.* We show that the value distribution (complex oscillation) of solutions of certain periodic second order ordinary differential equations studied by Bank, Laine and Langley is closely related to confluent hypergeometric functions, Bessel functions and Bessel polynomials. As a result, we give a complete characterization of the zero-distribution in the sense of Nevanlinna theory of the solutions for two classes of the ODEs. Our approach uses special functions and their asymptotics. New results concerning finiteness of the number of zeros (finite-zeros) problem of Bessel and Coulomb wave functions with respect to the parameters are also obtained as a consequence. We demonstrate that the problem for the remaining class of ODEs not covered by the above “special function approach” can be described by a classical Heine problem for differential equations that admit polynomial solutions.

## 1 Introduction and Main Results

We consider value distribution problems of the solutions of certain ordinary differential equations of the form

$$(1.1) \quad f''(z) + A(z)f(z) = 0,$$

where

$$(1.2) \quad A(z) = B(e^z), \quad B(\zeta) = \frac{K_0}{\zeta^4} + \dots + K_0 + \dots + K_k \zeta^k, \quad K_\ell K_k \neq 0.$$

Such equations always admit entire solutions. We recall that the order of  $f$  is defined by  $\sigma(f) = \limsup_{r \rightarrow \infty} \log \log M(r, f) / \log r$ , where  $M(r, f) = \max_{|z|=r} |f(z)|$  denotes the maximum modulus of  $f$ . The “density” of the zeros of  $f$  is given by  $\lambda(f) = \limsup_{r \rightarrow \infty} \log n(r, f) / \log r$ , known as the exponent of convergence of  $f$ , where  $n(r, f)$  denote the number of the zeros of  $f$  in  $|z| < r$ . It is elementary to use Nevanlinna theory [25, 34] to deduce that any solution  $f$  of (1.1), where  $A(z)$  can

**Selected Papers on Differential Equations and Analysis**, 2005 Contains translations of papers that originally appeared in the Japanese journal Sugaku This book covers a variety of topics including differential equations with free boundary singular integral operators and operator algebras It is suitable for graduate students and research mathematicians interested in analysis and differential equations

**Manifolds and Modular Forms** Friedrich Hirzebruch, Thomas Berger, Rainer Jung, 2013-06-29 This book provides a comprehensive introduction to the theory of elliptic genera due to Ochanine Landweber Stong and others The theory describes a new cobordism invariant for manifolds in terms of modular forms The book evolved from notes of a course given at the University of Bonn After providing some background material elliptic genera are constructed including the classical genera signature and the index of the Dirac operator as special cases Various properties of elliptic genera are discussed especially their behaviour in fibre bundles and rigidity for group actions For stably almost complex manifolds the theory is extended to elliptic genera of higher level The text is in most parts self contained The results are illustrated by explicit examples and by comparison with well known theorems The relevant aspects of the theory of modular forms are derived in a separate appendix providing also a useful reference for mathematicians working in this field

**Conjectures in Arithmetic Algebraic Geometry** Wilfred W. J. Hulsbergen, 2013-06-29 In this expository text we sketch some interrelations between several famous conjectures in number theory and algebraic geometry that have intrigued mathematicians for a long period of time Starting from Fermat's Last Theorem one is naturally led to introduce L functions the main motivation being the calculation of class numbers In particular Kummer showed that the class numbers of cyclotomic fields play a decisive role in the corroboration of Fermat's Last Theorem for a large class of exponents Before Kummer Dirichlet had already successfully applied his L functions to the proof of the theorem on arithmetic progressions Another prominent appearance of an L function is Riemann's paper where the now famous Riemann Hypothesis was stated In short nineteenth century number theory showed that much if not all of number theory is reflected by properties of L functions Twentieth century number theory class field theory and algebraic geometry only strengthen the nineteenth century number theorists' view We just mention the work of Hecke E Artin A Weil and A Grothendieck with his collaborators Hecke generalized Dirichlet's L functions to obtain results on the distribution of primes in number fields Artin introduced his L functions as a non abelian generalization of Dirichlet's L functions with a generalization of class field theory to non abelian Galois extensions of number fields in mind

**Explorations in Complex Functions** Richard Beals, Roderick S. C. Wong, 2020-10-19 This textbook explores a selection of topics in complex analysis From core material in the mainstream of complex analysis itself to tools that are widely used in other areas of mathematics this versatile compilation offers a selection of many different paths Readers interested in complex analysis will appreciate the unique combination of topics and connections collected in this

book Beginning with a review of the main tools of complex analysis harmonic analysis and functional analysis the authors go on to present multiple different self contained avenues to proceed Chapters on linear fractional transformations harmonic functions and elliptic functions offer pathways to hyperbolic geometry automorphic functions and an intuitive introduction to the Schwarzian derivative The gamma beta and zeta functions lead into L functions while a chapter on entire functions opens pathways to the Riemann hypothesis and Nevanlinna theory Cauchy transforms give rise to Hilbert and Fourier transforms with an emphasis on the connection to complex analysis Valuable additional topics include Riemann surfaces steepest descent tauberian theorems and the Wiener Hopf method Showcasing an array of accessible excursions Explorations in Complex Functions is an ideal companion for graduate students and researchers in analysis and number theory Instructors will appreciate the many options for constructing a second course in complex analysis that builds on a first course prerequisite exercises complement the results throughout
