*The Mobile Agent Rendezvous Problem in the Ring* Evangelos Kranakis, Danny Krizanc, Euripides Marcou, 2022-05-31

Mobile agent computing is being used in fields as diverse as artificial intelligence computational economics and robotics Agents ability to adapt dynamically and execute asynchronously and autonomously brings potential advantages in terms of fault tolerance flexibility and simplicity This monograph focuses on studying mobile agents as modelled in distributed systems research and in particular within the framework of research performed in the distributed algorithms community It studies the fundamental question of how to achieve rendezvous the gathering of two or more agents at the same node of a network Like leader election such an operation is a useful subroutine in more general computations that may require the agents to synchronize share information divide up chores etc The work provides an introduction to the algorithmic issues raised by the rendezvous problem in the distributed computing setting For the most part our investigation concentrates on the simplest case of two agents attempting to rendezvous on a ring network Other situations including multiple agents faulty nodes and other topologies are also examined An extensive bibliography provides many pointers to related work not covered in the text The presentation has a distinctly algorithmic rigorous distributed computing flavor and most results should be easily accessible to advanced undergraduate and graduate students in computer science and mathematics departments
