System Identification A Frequency Domain Approach:

System Identification Rik Pintelon, Johan Schoukens, 2012-04-04 System identification is a general term used to describe mathematical tools and algorithms that build dynamical models from measured data Used for prediction control physical interpretation and the designing of any electrical systems they are vital in the fields of electrical mechanical civil and chemical engineering Focusing mainly on frequency domain techniques System Identification A Frequency Domain Approach Second Edition also studies in detail the similarities and differences with the classical time domain approach It high lights many of the important steps in the identification process points out the possible pitfalls to the reader and illustrates the powerful tools that are available Readers of this Second Editon will benefit from MATLAB software support for identifying multivariable systems that is freely available at the website <http://booksupport.wiley.com> State of the art system identification methods for both time and frequency domain data New chapters on non parametric and parametric transfer function modeling using non period excitations Numerous examples and figures that facilitate the learning process A simple writing style that allows the reader to learn more about the theoretical aspects of the proofs and algorithms Unlike other books in this field System Identification Second Edition is ideal for practicing engineers scientists researchers and both master s and PhD students in electrical mechanical civil and chemical engineering

System Identification Rick Pintelon, Johan Schoukens, 2001

System Identification Rik Pintelon, Johan Schoukens, 2004-03-22 Electrical Engineering System Identification A Frequency Domain Approach How does one model a linear dynamic system from noisy data This book presents a general approach to this problem with both practical examples and theoretical discussions that give the reader a sound understanding of the subject and of the pitfalls that might occur on the road from raw data to validated model The emphasis is on robust methods that can be used with a minimum of user interaction Readers in many fields of engineering will gain knowledge about Choice of experimental setup and experiment design Automatic characterization of disturbing noise Generation of a good plant model Detection qualification and quantification of nonlinear distortions Identification of continuous and discrete time models Improved model validation tools and from the theoretical side about System identification Interrelations between time and frequency domain approaches Stochastic properties of the estimators Stochastic analysis System Identification A Frequency Domain Approach is written for practicing engineers and scientists who do not want to delve into mathematical details of proofs Also it is written for researchers who wish to learn more about the theoretical aspects of the proofs Several of the introductory chapters are suitable for undergraduates Each chapter begins with an abstract and ends with exercises and examples are given throughout

System Identification (SYSID '03) Paul Van Den Hof, Bo Wahlberg, Siep Weiland, 2004-06-29 The scope of the symposium covers all major aspects of system identification experimental modelling signal processing and adaptive control ranging from theoretical methodological and scientific developments to a large variety

of engineering application areas It is the intention of the organizers to promote SYSID 2003 as a meeting place where scientists and engineers from several research communities can meet to discuss issues related to these areas Relevant topics for the symposium program include Identification of linear and multivariable systems identification of nonlinear systems including neural networks identification of hybrid and distributed systems Identification for control experimental modelling in process control vibration and modal analysis model validation monitoring and fault detection signal processing and communication parameter estimation and inverse modelling statistical analysis and uncertainty bounding adaptive control and data based controller tuning learning data mining and Bayesian approaches sequential Monte Carlo methods including particle filtering applications in process control systems motion control systems robotics aerospace systems bioengineering and medical systems physical measurement systems automotive systems econometrics transportation and communication systems Provides the latest research on System Identification Contains contributions written by experts in the field Part of the IFAC Proceedings Series which provides a comprehensive overview of the major topics in control engineering

Nonlinear System Identification Stephen A. Billings, 2013-07-29 Nonlinear System Identification NARMAX Methods in the Time Frequency and Spatio Temporal Domains describes a comprehensive framework for the identification and analysis of nonlinear dynamic systems in the time frequency and spatio temporal domains This book is written with an emphasis on making the algorithms accessible so that they can be applied and used in practice Includes coverage of The NARMAX nonlinear autoregressive moving average with exogenous inputs model The orthogonal least squares algorithm that allows models to be built term by term where the error reduction ratio reveals the percentage contribution of each model term Statistical and qualitative model validation methods that can be applied to any model class Generalised frequency response functions which provide significant insight into nonlinear behaviours A completely new class of filters that can move split spread and focus energy The response spectrum map and the study of sub harmonic and severely nonlinear systems Algorithms that can track rapid time variation in both linear and nonlinear systems The important class of spatio temporal systems that evolve over both space and time Many case study examples from modelling space weather through identification of a model of the visual processing system of fruit flies to tracking causality in EEG data are all included to demonstrate how easily the methods can be applied in practice and to show the insight that the algorithms reveal even for complex systems NARMAX algorithms provide a fundamentally different approach to nonlinear system identification and signal processing for nonlinear systems NARMAX methods provide models that are transparent which can easily be analysed and which can be used to solve real problems This book is intended for graduates postgraduates and researchers in the sciences and engineering and also for users from other fields who have collected data and who wish to identify models to help to understand the dynamics of their systems *Identification and System Parameter Estimation* Rolf Isermann, 1980
