Astronomical Photometry and Spectroscopy in the Optical and Near-Infrared Regions B.G. Anandarao,V.

Venkataraman,2025-09-22 Astronomical Photometry and Spectroscopy by B G Anandarao and V Venkata Raman is a thorough exploration of observational astronomy covering the techniques of photometry and spectroscopy in the optical and near infrared regions With a general introduction to astronomical objects and radiation processes the book delves into the principles of telescopes detectors photometry and spectroscopy The authors provide examples and describe data processing and enhancement techniques making it an invaluable resource for postgraduate students and young research workers in astronomy and astrophysics The book s comprehensive coverage and detailed explanations make it an essential guide for those seeking to understand the underlying physical processes of celestial phenomena Contents 1 Introduction 2 Telescopes and Detectors 3 Radiation Processes and Atomic and Molecular Spectroscopy 4 Photometric Techniques 5 Spectroscopic Techniques 6 Data Quality Enhancement Techniques 7 Epilogue

Astronomy in the Near-Infrared - Observing Strategies and Data Reduction Techniques Jochen Heidt,2022-07-04 Near infrared astronomy has become one of the most rapidly developing branches in modern astrophysics Innovative observing techniques near infrared detectors with quantum efficiencies in excess of 90% highly specialised instruments as well as advanced data reduction techniques have allowed major breakthroughs in various areas like exoplanets star forming regions the supermassive black hole in the Galactic center and the high redshift Universe In this book the reader will be introduced to the basic concepts of how to prepare near infrared observations with maximized scientific return Equal weight is given to all aspects of the data reduction for both imaging and spectroscopy Information is also provided on the state of the art instrumentation available and planned on detector technology or the physics of the atmosphere all of which influence the preparation and execution of observations and data reduction techniques The beginner but also the expert will find a lot of information in compact form which is otherwise widely dispersed across the internet or other sources

New Developments in Array Technology and Applications A.G. Davis Philip,Kenneth A. Janes,Arthur R. Upgren,2012-12-06 IAU Symposium No 167 brought together researchers who use CCDs and arrays designers and manufacturers of CCDs and Array Mosaics and those who write the software to control these devices and to reduce the large amounts of data contained in each frame At the meeting such topics as plans for applying the new technology to the new large telescopes that have been built recently and those planned in the near future new developments in infrared arrays advances and concerns with the use of CCDs in photometry and spectroscopy and the creation of large mosaics in photometry and spectroscopy and the creation of large mosaics of chips which allow larger areas of the sky to be covered in a single frame were discussed There were sessions devoted to the following topics New Developments in CCD Technology New Developments in IR Detector Arrays Direct Imaging with CCDs and Other Arrays Spectroscopy with CCDs and Other Arrays and Large Field Imaging with Array Mosaics Scientific results of studies made

with this technology were covered in the poster sessions CCD and Array Detectors have become the detectors of choice at all the world's optical observatories. Such instruments on small university and college telescopes have turned these telescopes into instruments that can now do observations which in the past were done only on the largest telescopes. CCDs and Arrays are known as the people's detector because of their ability to turn small telescopes into true research instruments. On large telescopes observations can be made of extremely faint and crowded objects that were impossible to observe before the advent of CCD and Array technology. The proceedings of this meeting will be useful to all those who are interested in the design, manufacture, and use of CCDs and Arrays for astronomical observations.

Data Analysis in Astronomy II V. di Gesù, L. Scarsi, 2013-03-09. The II international workshop on Data Analysis in Astronomy was intended to provide an overview on the state of the art and the trend in data analysis and image processing in the context of their applications in Astronomy. The need for the organization of a second workshop in this subject derived from the steady growing and development in the field and from the increasing cross interaction between methods, technology, and applications in Astronomy. The book is organized in four main sections: Data Analysis Methodologies, Data Handling and Systems dedicated to Large Experiments, Parallel Processing, and New Developments. The topics which have been selected cover some of the main fields in data analysis in Astronomy. Methods that provide a major contribution to the physical interpretation of the data have been considered. Attention has been devoted to the description of the data analysis and handling organization in very large experiments. A review of the current major satellite and ground-based experiments has been included. At the end of the book, the following Panel Discussions are included: Data Analysis Trend in Optical and Radio Astronomy, Data Analysis Trend in X and Gamma Astronomy, Problems and Solutions in the Design of Very Large Experiments, and Trend on Parallel Processing Algorithms. These contributions, in a sense, summarize the live reaction of the audience to the various topics.

Observational Constraints on the Influence of Active Galactic Nuclei on the Evolution of Galaxies Christopher Mark Harrison, 2016-01-20. This prize-winning Ph.D. thesis by Chris Harrison adopts a multi-faceted approach to address the lack of decisive observational evidence utilising large observational data sets from several world-leading telescopes. Developing several novel observational techniques, Harrison demonstrated that energetic winds driven by Active Galactic Nuclei (AGN) are found in a large number of galaxies with properties in agreement with model predictions. One of the key unsolved problems in astrophysics is understanding the influence of AGN, the sites of growing supermassive black holes, on the evolution of galaxies. Leading theoretical models predict that AGN drive energetic winds into galaxies, regulating the formation of stars. However, until now we have lacked the decisive observational evidence to confirm or refute these key predictions. Careful selection of targets allowed Harrison to reliably place these detailed observations into the context of the overall galaxy population. However, in disagreement with the model predictions, Harrison showed that AGN have little global effect on star formation in galaxies. Theoretical models are now left with the challenge of explaining these results.
