Abstract

Electrochemical molecular intercalation of layered semiconducting crystals with organic cations followed by ultrasonic exfoliation has proven to be an effective approach to producing a rich family of organic/inorganic hybrid superlattices and high-quality, solution-processable 2D semiconductors. A traditional method for exfoliating 2D crystals relies on the intercalation of inorganic alkali metal cations. The organic cations (e.g., alkyl chain-substituted quaternary ammonium cations) are much larger than their inorganic counterparts, and the bulky molecular structure endows distinct intercalation and exfoliation chemistry, as well as molecular tunability. By using this protocol, many layered 2D crystals (including graphene, black phosphorus and versatile metal chalcogenides) can be electrochemically intercalated with organic quaternary alkylammonium cations. Subsequent solution-phase exfoliation of the intercalated compounds is realized by regular bath sonication for a short period (5–30 min) to produce free-standing, thin 2D nanosheets. It is also possible to graft additional ligands on the nanosheet surface. The thickness of the exfoliated nanosheets can be measured by using atomic force microscopy and Raman spectroscopy. Modifying the chemical structure and geometrical configuration of alkylammonium cations results in different exfoliation behavior and a family of versatile organic/inorganic hybrid superlattices with tunable physical/chemical properties. The whole protocol takes ~6 h for the successful production of stable, ultrathin 2D nanosheet dispersion in solution and another 11 h for depositing thin films and transferring them onto an arbitrary surface. This protocol does not require expertise beyond basic electrochemistry knowledge and conventional colloidal nanocrystal synthesis and processing.

Key points

- A layered semiconductor crystal that undergoes electrochemical intercalation with alkyl chain-substituted quaternary ammonium cations can be exfoliated into free-standing 2D nanosheets by sonication. The resulting 2D nanosheets in solution are spin-coated to form thin films on versatile substrates for electronic applications.
- The main advantage is the preservation of semiconducting characteristics (e.g., MoS₂) in the exfoliated nanosheets and assembled thin films.

D.), 2017 The success in creating atomically thin and mechanically robust two dimensional 2D crystals starting with graphene has unveiled new possibilities for next generation of ultrafast and ubiquitous electronics One critical distinction between 2D crystals and 3D crystals is that 2D crystals are all surface materials Therefore it is essential to understand how 2D materials interact with their environments and how this interaction impacts their electronic properties From a practical perspective it also provides us with a unique tool to tailor the electronic properties of 2D materials through surface functionalization In the first half of this thesis a suite of X ray techniques is used to investigate how the surface functionalizing dopants will impact the electronic and chemical states of graphene Based on this study we develop an effective and non invasive doping method for graphene through plasma based chlorination In order to make system level 2D electronics successful a flexible and ubiquitous energy harvesting solution is indispensable Therefore the second part of this thesis is dedicated to the development of a MoS₂ 2H 1T phase heterojunction based GHz flexible rectifier as an enabling component for wireless energy harvester It is the first flexible rectifier operating up to the X band and it covers most of the unlicensed industrial scientific and medical ISM radio band including the Wi Fi channels By integrating this rectifier with an antenna the MoS₂ enabled rectenna successfully demonstrates direct energy harvesting of electromagnetic EM radiation in the Wi Fi band and lights up a commercial light emitting diode LED with zero external bias battery free Moreover our MoS₂ rectifier also realizes successful frequency conversion as a mixer beyond 10 GHz on flexible substrates This work provides a universal energy harvesting building block that can be integrated with various wearable electronic systems and paves the way towards using the existing Wi Fi infrastructure as an energy hotspot for wireless charging *Superconductivity in Two-Dimensional Crystals* Mohammed El-Bana, 2015-09-07 This book would be exciting to people that their interests broadly encompass condensed matter physics as a whole but lie in particular in the area of graphene like 2D materials and in the area of superconductivity The discovery of graphene opens up the possibility of new and exciting physics in a new class of materials It was exhibited that single layer graphene can carry significant proximity supercurrents Fabrication of graphene Josephson junctions enabled me to study the rare intersection of relativity and superconductivity This initial work was extended to investigate 2D superconducting
