Wilks, 2023-04-25 A fascinating richly illustrated journey through the history of artificial intelligence and an honest assessment of our future alongside it Artificial intelligence has long been a mainstay of science fiction and increasingly it feels as if AI is entering our everyday lives with virtual personal assistants such as Apple's Siri now ubiquitous and self driving cars almost upon us But what do we actually mean when we talk about artificial intelligence In this comprehensive beautifully illustrated account AI expert Yorick Wilks traces the history of artificial intelligence back to its origins examining not only how it works and why it was designed but also its controversies and achievements Along the way Wilks also considers our future with AI assessing whether these technologies will benefit humanity or merely menace our way of life Are the sentient machines of 2001 A Space Odyssey or The Matrix plausible or will real world AI look and feel very different What has AI done for us so far What do we want it to do And what technologies could it yield in the future Entertaining enlightening and keenly argued Artificial Intelligence Modern Magic or Dangerous Future is the essential guide to the AI debate *Cognitive Dynamics* Eric Dietrich, Arthur B. Markman, 2014-03-05 Recent work in cognitive science much of it placed in opposition to a computational view of the mind has argued that the concept of representation and theories based on that concept are not sufficient to explain the details of cognitive processing These attacks on representation have focused on the importance of context sensitivity in cognitive processing on the range of individual differences in performance and on the relationship between minds and the bodies and environments in which they exist In each case models based on traditional assumptions about representation have been assumed to be too rigid to account for the effects of these factors on cognitive processing In place of a representational view of mind other formalisms and methodologies such as nonlinear differential equations or dynamical systems and situated robotics have been proposed as better explanatory tools for understanding cognition This book is based on the notion that while new tools and approaches for understanding cognition are valuable representational approaches do not need to be abandoned in the course of constructing new models and explanations Rather models that incorporate representation are quite compatible with the

kinds of complex situations being modeled with the new methods This volume illustrates the power of this explicitly representational approach labeled cognitive dynamics in original essays by prominent researchers in cognitive science Each chapter explores some aspect of the dynamics of cognitive processing while still retaining representations as the centerpiece of the explanations of the key phenomena These chapters serve as an existence proof that representation is not incompatible with the dynamics of cognitive processing The book is divided into sections on foundational issues about the use of representation in cognitive science the dynamics of low level cognitive processes such as visual and auditory perception and simple lexical priming and the dynamics of higher cognitive processes including categorization analogy and decision making
