Inclusion Chemistry with Zeolites: Nanoscale Materials by Design N. Herron, D.R. Corbin, 2012-12-06 Zeolites with their crystalline microporous structures are cordial hosts to a wide variety of guests However it was the abrupt and unexpected departure of one of these guests water from a host stilbite on heating which led Cronstedt in 1756 to coin the term zeolite from the Greek meaning boiling stone to describe this material Since that time approximately 40 different naturally occurring zeolites have been discovered on earth Recent studies of meteorite compositions have shown that these guest host materials e g sodalite occur in other parts of the universe as well However it wasn't until the twentieth century that synthetic routes to zeolites and other non aluminosilicate molecular sieves were discovered In addition with the development of X ray diffraction and the various spectroscopies better understanding of the nature of the cavities cages and channels of these materials has led to the industrial exploitation of their guest host properties The world of zeolites has now expanded into a greater than 2 billion pound per year business with major applications in detergent formulations catalysis and as adsorbents and desiccants Their economic impact is difficult to determine however the improvement in gasoline yields alone from catalytic cracking must account for hundreds of billions of dollars in increased GDP In this volume we have brought together a sampling of recent developments in various areas of guest host or inclusion chemistry in zeolites

Fifteen chapters present original papers on various facets of inorganic materials chemistry. The first six papers focus on topics in solid state inorganic chemistry directed toward materials problems e.g. the synthesis and characterization of unusual polar intermetallics, exploitation of Zintl phases in the pursuit of novel magnetic and electronic materials and new donors/acceptors for molecule based magnetism research. The second part highlights the preparation and characterization of thin films e.g. new routes toward chemical and photochemical vapor deposition of copper metal, new materials for Si based heterostructure engineering, Sol Gel processed materials in the automotive industry and nanometer scale fabrication of self assembled monolayers.
