Electron Crystallography Xiaodong Zou, Sven Hovmöller, Peter Oleynikov, 2011-08-18 In the modern world of ever smaller devices and nanotechnology electron crystallography emerges as the most important method capable of determining the structure of minute objects down to the size of individual atoms Crystals of only a few millionths of a millimetre are studied This is the first textbook explaining how this is done Great attention is given to symmetry in crystals and how it manifests itself in electron microscopy and electron diffraction and how this symmetry can be determined and taken advantage of in achieving improved electron microscopy images and solving crystal structures from electron diffraction patterns Theory and practice are combined experimental images diffraction patterns formulae and numerical data are discussed in parallel giving the reader a complete understanding of what goes on inside the black boxes of computer programs This up to date textbook contains the newest techniques in electron crystallography including detailed descriptions and explanations of the recent remarkable successes in determining the very complex structures of zeolites and intermetallics The controversial issue of whether there is phase information present in electron microscopy images or not is also resolved once and for all The extensive appendices include computer labs which have been used at various courses at Stockholm University and international schools in electron crystallography with applications to the textbook Students can download image processing programs and follow these lab instructions to get a hands on experience of electron crystallography

[Electron Crystallography](#) Thomas E. Weirich, János L. Lábár, Xiaodong Zou, 2006-01-16 During the last decade we have been witness to several exciting achievements in electron crystallography This includes structural and charge density studies on organic molecules complicated inorganic and metallic materials in the amorphous nano meso and quasi crystalline state and also development of new software tailor made for the special needs of electron crystallography Moreover these developments have been accompanied by a now available new generation of computer controlled electron microscopes equipped with high coherent field emission sources cryo specimen holders ultra fast CCD cameras imaging

plates energy filters and even correctors for electron optical distortions Thus a fast and semi automatic data acquisition from small sample areas similar to what we today know from imaging plates diffraction systems in X ray crystallography can be envisioned for the very near future This progress clearly shows that the contribution of electron crystallography is quite unique as it enables to reveal the intimate structure of samples with high accuracy but on much smaller samples than have ever been investigated by X ray diffraction As a tribute to these tremendous recent achievements this NATO Advanced Study Institute was devoted to the novel approaches of electron crystallography for structure determination of nanosized materials

crystallographic computing crystal physics and other fields of crystallographic research Graduate students specializing in crystallography will find much material suitable for self study and a rich source of references to the relevant literature New to this edition A new chapter on modern extensions of the Ewald method for Coulomb interactions in crystals Three new sections on electron diffraction and electron microscopy in structure determination describing point group and space group determination by convergent beam electron diffraction three dimensional reconstruction and single particle reconstruction Substantial revisions to the chapters on space group representations in reciprocal space direct methods Patterson and molecular replacement techniques and disorder diffuse scattering More information on the series can be found at <http://it.iucr.org>

Uniting Electron Crystallography and Powder Diffraction Ute Kolb, Kenneth Shankland, Louisa Meshi, Anatoly Avilov, William I.F David, 2012-12-20 The polycrystalline and nanocrystalline states play an increasingly important role in exploiting the properties of materials encompassing applications as diverse as pharmaceuticals catalysts solar cells and energy storage A knowledge of the three dimensional atomic and molecular structure of materials is essential for understanding and controlling their properties yet traditional single crystal X ray diffraction methods lose their power when only polycrystalline and nanocrystalline samples are available It is here that powder diffraction and single crystal electron diffraction techniques take over substantially extending the range of applicability of the crystallographic principles of structure determination This volume a collection of teaching contributions presented at the Crystallographic Course in Erice in 2011 clearly describes the fundamentals and the state of the art of powder diffraction and electron diffraction methods in materials characterisation encompassing a diverse range of disciplines and materials stretching from archeometry to zeolites As such it is a comprehensive and valuable resource for those wishing to gain an understanding of the broad applicability of these two rapidly developing fields
