Structure Glass Technology Katherine Kristen Leitch, 2005 Glass cannot compete with steel in terms of strength or durability but it is the only structural material that offers the highly sought after qualities of translucency and transparency The use of glass has evolved from purely decorative or architectural to structural encouraging glass technologies to advance concurrently with increased demand As a result contemporary methods used to produce structural glass provide excellent strength characteristics particularly after treatments including annealing tempering and heat strengthening which reduce its vulnerability to cracking and sudden brittle failure Its modulus of elasticity is roughly equal to that of aluminum greater than both wood and concrete but doesn't allow any plastic deformation Lamination dramatically improves both the strength and durability of glass by joining strengthened layers of glass using resin or a polyvinyl butyral foil No comprehensive design code is currently available to aid in the design of structural glass members The behavior of glass is examined through a variety of structural applications including beams columns walls roofs and floors and domes Case studies are explored to underscore the technical principles discussed for each structural glass element utilized in place of more traditional building materials
