Structures Of Electrified Interfaces:

Structure of Electrified Interfaces Jacek Lipkowski, Philip N. Ross, 1993 This second volume in the Frontiers of Electrochemistry series provides a modern description of the metal solution interface and describes the advances made in interfacial electrochemistry during the past decade Contributing authors summarize the impact of new ex situ and in situ techniques in studying electrode surfaces and illustrate the significance of the development of new experimental techniques and the availability of reliable data in the theory of electrified interfaces The review articles demonstrate how a molecular picture of the interface has emerged from traditional models that treated the solution as a dielectric and metal as an electronic continuum Annotation copyright by Book News Inc Portland OR

Electrified Interfaces in Physics, Chemistry and Biology R Guidelli, 2012-12-06 Electrified interfaces span from metal/semiconductor and metal/electrolyte interfaces to dispersed systems and biological membranes and are notably important in so many physical chemical and biological systems that their study has been tackled by researchers with different scientific backgrounds using different methodological approaches The various electrified interfaces have several common features The equilibrium distribution of positive and negative ions in an electrolytic solution is governed by the same Poisson Boltzmann equation independent of whether the solution comes into contact with a metal a colloidal particle or a biomembrane and the same is true for the equilibrium distribution of free electrons and holes of a semiconductor in contact with a different conducting phase Evaluation of electric potential differences across biomembranes is based on the same identity of electrochemical potentials which holds for a glass electrode and which yields the Nernst equation when applied to a metal solution interface The theory of thermally activated electron tunneling which was developed by Marcus Levich Dogonadze and others to account for electron transfer across metal/electrolyte interfaces is also applied to light induced charge separation and proton translocation reactions across intercellular membranes From an experimental viewpoint the same electrochemical and in situ spectroscopic techniques can equally well be employed for the study of apparently quite

different electrified interfaces
