Statistical Methods for Environmental Pollution Monitoring Richard O. Gilbert, 1987 This book discusses a broad range of statistical design and analysis methods that are particularly well suited to pollution data It explains key statistical techniques in easy to comprehend terms and uses practical examples exercises and case studies to illustrate procedures Dr Gilbert begins by discussing a space time framework for sampling pollutants He then shows how to use statistical sample survey methods to estimate average and total amounts of pollutants in the environment and how to determine the number of field samples and measurements to collect for

this purpose Then a broad range of statistical analysis methods are described and illustrated These include determining the number of samples needed to find hot spots analyzing pollution data that are lognormally distributed testing for trends over time or space estimating the magnitude of trends comparing pollution data from two or more populations New areas discussed in this sourcebook include statistical techniques for data that are correlated reported as less than the measurement detection limit or obtained from field composited samples Nonparametric statistical analysis methods are emphasized since parametric procedures are often not appropriate for pollution data This book also provides an illustrated comprehensive computer code for nonparametric trend detection and estimation analyses as well as nineteen statistical tables to permit easy application of the discussed statistical techniques In addition many publications are cited that deal with the design of pollution studies and the statistical analysis of pollution data This sourcebook will be a useful tool for applied statisticians ecologists radioecologists hydrologists biologists environmental engineers and other professionals who deal with the collection analysis and interpretation of pollution in air water and soil
