Stochastic Two Stage Programming:

Stochastic Two-Stage Programming Karl Frauendorfer, 2012-12-06 Stochastic Programming offers models and methods for decision problems where some of the data are uncertain. These models have features and structural properties which are preferably exploited by SP methods within the solution process. This work contributes to the methodology for two stage models. In these models the objective function is given as an integral whose integrand depends on a random vector on its probability measure and on a decision. The main results of this work have been derived with the intention to ease these difficulties. After investigating duality relations for convex optimization problems with supply demand and prices being treated as parameters a stability criterion is stated and proves subdifferentiability of the value function. This criterion is employed for proving the existence of bilinear functions which minorize/majorize the integrand. Additionally these minorants/majorants support the integrand on generalized barycenters of simplicial faces of specially shaped polytopes and amount to an approach which is denoted barycentric approximation scheme.

Decision Making with Dominance Constraints in Two-Stage Stochastic Integer Programming Uwe Gotzes, 2009-09-30 Uwe Gotzes analyzes an approach to account for risk aversion in two stage models based upon partial orders on the set of real random variables. He illustrates the superiority of the proposed decomposition method over standard solvers for example with numerical experiments with instances from energy investment.

Two-Stage Stochastic Linear Programming With Recourse DAVID T. MILLS, 2025-05-22 The LP recourse problem applies to two stage optimization problems where uncertainty in resource availability of the second stage hinders informed decision making. The recourse function affords a way to compensate later for an error in prediction. Now the literature provides a rich body of work on the optimization of such problems but little research has been accomplished regarding the characterization of the surface in the local region of optimality in particular sensitivity analysis. A decision maker faced with considerations other than the modeled objective function must be presented with a way to estimate the impact of operating at non optimal decision variable values. This work develops and demonstrates a technique for characterizing the surface using response surface methodology. Specifically the flexibility and utility of RSM techniques applied to this class of problems is demonstrated and a methodology for characterizing the surface in the local region using a low order polynomial is developed.
