satisfy people's information needs as well as confer on them a competitive advantage. The emergence of battery-operated low cost and portable computers such as palmtops and PDAs coupled with the availability and exploitation of wireless networks have made possible the potential for ubiquitous computing. Through the wireless networks portable equipments will become an integrated part of existing distributed computing environments and mobile users can have access to data stored at information servers located at the static portion of the network even while they are on the move. Traditionally information is retrieved following a request-response model. However this model is no longer adequate in a wireless computing environment. First the wireless channel is unreliable and the bandwidth is low compared to the wired counterpart. Second the environment is essentially asymmetric with a large number of mobile users accessing a small number of servers. Third battery-operated portable devices can typically operate only for a short time because of the short battery lifespan. Thus clients are expected to be disconnected most of the time. To overcome these limitations there has been a proliferation of research efforts on designing data delivery mechanisms to support wireless computing more effectively. *Data Dissemination in Wireless Computing Environments* focuses on such mechanisms. The purpose is to provide a thorough and comprehensive review of recent advances on energy efficient data delivery protocols, efficient wireless channel bandwidth utilization, reliable broadcasting and cache invalidation strategies for clients with long disconnection time. Besides surveying existing methods, this book also compares and evaluates some of the more promising schemes. *Just Enough Wireless Computing* Ian S. Hayes, 2003. Wireless technology offers immense potential for competitive advantage starting right now but today's wireless landscape can be extraordinarily confusing. This book gives decision makers the clarity, insight and practical methodology they need to identify the right wireless solutions and implement them. Ian S. Hayes offers a practical framework for understanding today's complex array of wireless devices, solution providers, technologies, standards, architectures and acronyms. Through real world case studies, practical examples and illustrations, he helps you determine which wireless solutions offer the greatest business value in your environment and walks you through assembling and integrating those solutions. The book contains a detailed glossary of terminology as well as a comprehensive list of software vendors and consultants, updated on an ongoing basis at the book's companion Web site. **WIRELESS NETWORKS AND MOBILE COMPUTING.** Koushik Ghosh, Sinha (Sasthi C. Sinha, Bhayani P.), 2023. **Wireless Internet and Mobile Computing** Yu-Kwong Ricky Kwok, Vincent K.N. Lau, 2007-09-10. This book describes the technologies involved in all aspects of a large networking system and how the various devices can interact and communicate with each other. Using a bottom-up approach, the authors demonstrate how it is feasible for instance for a cellular device user to communicate via the all-purpose TCP/IP protocols with a wireless notebook computer user traversing all the way through a base station in a cellular wireless network, e.g. GSM, CDMA, a public switched network, PSTN, the Internet, an intranet, a local area network, LAN, and a wireless LAN access point. The information bits in travelling through this long path are processed by numerous disparate

communication technologies The authors also describe the technologies involved in infrastructure less wireless networks

Advances on Broadband and Wireless Computing, Communication and Applications Leonard Barolli, Fang-Yie Leu, Tomoya Enokido, Hsing-Chung Chen, 2018-10-18. This book presents on the latest research findings and innovative research methods and development techniques related to the emerging areas of broadband and wireless computing from both theoretical and practical perspectives. Information networking is evolving rapidly with various kinds of networks with different characteristics emerging and being integrated into heterogeneous networks. As a result, a number of interconnection problems can occur at different levels of the communicating entities and communication networks hardware and software design. These networks need to manage an increasing usage demand, provide support for a significant number of services, guarantee their QoS, and optimize the network resources. The success of all IP networking and wireless technology has changed the way of life for people around the world, and the advances in electronic integration and wireless communications will pave the way for access to the wireless networks on the fly. This in turn means that all electronic devices will be able to exchange the information with each other in a ubiquitous way whenever necessary.
