

General relativity

From the world learned of the revolutionary Special Theory of Relativity proposed by Albert Einstein and published in 1905, physics underwent its most revolutionary change since the days of Isaac Newton. Nevertheless, Einstein had yet another surprise left: the so-called General Theory of Relativity, of 1916—a much more complex and complete theory from which several interesting predictions arise and have been confirmed over time.

Why a second theory?

According to Einstein, the laws of physics are the same for all observers, but the way they are perceived is different. Einstein's theory of relativity is a generalization of Newton's theory of gravity, which is only valid in the case of weak gravitational fields. Einstein's theory of relativity is a generalization of Newton's theory of gravity, which is only valid in the case of weak gravitational fields.

A deformed universe

Einstein established that gravity was not a force, but rather the consequence of the deformation of space-time that any body with mass generates. Mass, when accumulating in a point, deforms the space around it, and objects do not move through that curved deformation.

Light that bends

Perhaps the most surprising confirmation of one of Einstein's predictions, based on the General Theory of Relativity, happened in 1919 during the course of a solar eclipse.

According to the General Theory of Relativity, the path of light is curved by the presence of mass. This was confirmed during the solar eclipse of 1919, when the light from distant stars was observed to be deflected by the Sun's gravity.

In 1919, the British astronomer Arthur Eddington led an expedition to observe the solar eclipse of May 29, 1919. The expedition was successful in measuring the deflection of starlight by the Sun's gravity, which confirmed Einstein's theory of relativity.

4 dimensions

For the universe according to Einstein's theory, although the space is three-dimensional, time is also a dimension, forming a four-dimensional continuum, which we call spacetime.

Gravitational lenses

Another prediction based on the General Theory of Relativity concerns gravitational lenses. Because of the deformation, which is also related to the attractive interaction caused by gravity, the image of certain far stars and galaxies is distorted when seen from the Earth.

HERSCHEL A. LIPKIN

The image of a distant star is distorted when it is seen from the Earth. This is because the light from the star is deflected by the gravity of the lensing object, which causes the image to be distorted. This is known as gravitational lensing.

Electromagnetic waves

Einstein theorized that as massive gravitational fields bend the trajectories of objects, in other words, they would make them lose energy. Electromagnetic waves, "particles" when being treated as such, are no exception. They, too, are affected, which causes a redshift or a blueshift in their frequency.

Perturbation of Mercury's orbit

Astronomers had discovered a discrepancy in the orbital position of the planet Mercury that could not be explained by Newtonian or classical physics without including some hypothetical planet. Einstein used his theory to explain the discrepancy, obtaining the position of the so-called planet.

Mercury's orbit is perturbed by the Sun's gravity. This is because the Sun's gravity is not perfectly spherical, which causes the orbit to be distorted. This is known as the precession of Mercury's perihelion.
