The Restricted 3body Problem:

The Stability of Planetary Systems R.L. Duncombe, Rudolf Dvorak, P.J. Message, 2012-12-06 The Alexander von Humboldt Colloquium on Celestial Mechanics sub titled The Stability of Planetary Systems was held in Ramsau Styria in the Austrian Alps from March the 25th to the 31st 1984 The dedication of the meeting to Alexander von Humboldt presented participants with the challenge that the discussions during the week should reflect the spirit of that great scientist of the last century that the very many interesting ideas presented and developed during the sessions should be interpreted in the light of a broad view of astronomy and astrophysics The topics of the meeting ranged from astrometric questions relating to the specification of inertial reference systems motion of planets including minor planets and satellites with the recurring topic of the search for criteria of stability of the systems resonances periodic orbits and to the origin of the systems Each session began with one or more invited review papers followed by offered contributions and discussion Three evening discussions were held devoted respectively to inertial systems to numerical integration techniques and to cosmogonic problems and ring systems On the evening of Wednesday March 28th a recital of chamber music was given by Bernhard Piberauer on the violin and Meinhard Prinz on the piano

Fundamentals of Astrodynamics and Applications D.A. Vallado, 2001-06-30 *Fundamentals of Astrodynamics and Applications* is rapidly becoming the standard astrodynamics reference for those involved in the business of spaceflight What sets this book apart is that nearly all of the theoretical mathematics is followed by discussions of practical applications implemented in tested software routines For example the book includes a compendium of algorithms that allow students and professionals to determine orbits with high precision using a PC Without a doubt when an astrodynamics problem arises in the future it will become standard practice for engineers to keep this volume close at hand and look it up in Vallado While the first edition was an exceptionally useful and popular book throughout the community there are a number of reasons why the second edition will be even more so There are many reworked examples and derivations Newly introduced topics include ground illumination calculations Moon rise and set and a listing of relevant Internet sites There is an improved and expanded discussion of coordinate systems orbit determination and differential correction Perhaps most important is that all of the software routines described in the book are now available for free in FORTRAN PASCAL and C This makes the second edition an even more valuable text and superb reference
