

Above: GFS sea-level pressure and 1000-500 hPa thickness valid for 25 Jan 2023 at 1200 UTC. The thickness contours (red lines) represent a sort of averaged temperature in the lower and middle tropopause. The size of the boxes formed by the juxtaposition of thickness and sea-level pressure lines is, approximately, inversely proportional to the magnitude of thermal advection. (AWIPS-II)

Right: Official NCEP GFS output of sea-level pressure (black solid lines) and thickness (red and blue dotted lines). The thickness contours are closely related to 500 mb and 300 mb height fields, so the rounded "thickness bullseye" off the California coast very likely corresponds to an upper-level low, and the large thermal troughing in the eastern regions are indicative of long wave troughing east of the Rockies. This makes the chart useful for a first guess at where upper-level jets, troughs, and ridges are.
