

WEATHER FORECASTING

Weather forecasting is the application of current technology and science to predict the state of the atmosphere for a future time and a given location. It is essential for especially for fishermen and farmers.

Weather forecasts are made by collecting as much data as possible about the current state of the atmosphere (particularly the temperature, humidity and wind) and using understanding of atmospheric processes (through meteorology) to determine how the atmosphere evolves in the future. However, the chaotic nature of the atmosphere and incomplete understanding of the processes mean that forecasts become less accurate as the range of the forecast increases. Traditional observations made at the surface of atmospheric pressure, temperature, wind speed, wind direction, humidity, precipitation are collected routinely from trained observers, automatic weather stations or buoys. During the data assimilation process, information gained from the observations is used in conjunction with a numerical model's most recent forecast for the time that observations were made to produce the meteorological analysis. Numerical weather prediction models are computer simulations of the atmosphere. They take the analysis as the starting point and evolve the state of the atmosphere forward in time using understanding of physics and fluid dynamics. The complicated equations which govern how the state of a fluid changes with time require supercomputers to solve them. The output from the model provides the basis of the weather forecast.

WEATHER FORECASTING FROM LOCAL INDICATORS

Ethnic tribes and other local people, especially farmers, fishers and hunters are very astute weather watchers and are quick to recognize weather conditions and whether. Local forecasting often combines empirical observations and weather predictions through the phenological patterns of plants and the behaviour of birds and other animals. The production and application of local forecasts are deeply localized, derived from an intimate interaction with a micro environment whose rhythms are intertwined with the cycles of seasonal changes. The vulnerability caused by vagaries of the weather creates a knowledge base among farmers in the form of Indigenous Technical Knowledge (ITK) that helps people to overcome uncertainty and prepare for possible adverse or favorable events. Local indicators and local knowledge systems cannot be replaced with scientific knowledge, because they are **holistic** and **specific to local situations**, providing farmers and others with the ability to make decisions and prepare for the coming agricultural year. Mechanisms for integrating both traditional and scientific weather forecast systems would reduce uncertainties and improve farm management, as well as provide a basis for integrating scientific forecasts into existing decision processes of farmers.

For the traditional weather forecasters, the phenology of certain plants and behaviors of certain animals is a reliable indicator of a wet or dry year, or for the onset of the rainy season or adverse weather conditions. Farmers often use such indicator plants and animals in planning for their cropping activities, especially when other indicators are not evident. There is a tendency for western-educated individuals to dismiss such traditional weather knowledge as simply a set of
