Unix Distributed Programming:

UNIX Distributed Programming Chris Brown, 1994 Taking a broad view of distributed programming within a UNIX environment this guide explains compares and contrasts the underlying support offered by UNIX for manipulating processes for inter process communication It covers a wide range of issues from simple pipes to traditional client server network applications to the exploitation of true concurrency and parallelism

Development of a Control Process for the Berkeley UNIX Distributed Programs Monitor Cathryn Marcia Macrander, 1984 Conventional programs have a single stream of execution Distributed programs expand on this notion having multiple streams of execution that interact with each other This expansion increases the complexity of a program s behavior Existing program monitors do not provide enough information to deal with all of the problems of a distributed computing environment This paper is concerned with the development of a programming tool for Berkeley UNIX whose goal is to characterize the performance of distributed programs

Java Distributed Computing Jim Farley, 1998-01-01 Distributed computing and Java go together naturally As the first language designed from the bottom up with networking in mind Java makes it very easy for computers to cooperate Even the simplest applet running in a browser is a distributed application if you think about it The client running the browser downloads and executes code that is delivered by some other system But even this simple applet wouldn t be possible without Java s guarantees of portability and security the applet can run on any platform and can t sabotage its host Of course when we think of distributed computing we usually think of applications more complex than a client and server communicating with the same protocol We usually think in terms of programs that make remote procedure calls access remote databases and collaborate with others to produce a single result Java Distributed Computing discusses how to design and write such applications It covers Java s RMI Remote Method Invocation facility and CORBA but it doesn t stop there it tells you how to design your own protocols to build message passing systems and discusses how to use Java s security facilities how to write multithreaded servers and more It pays special attention to distributed data systems collaboration and applications that have high bandwidth requirements In the future distributed computing can only become more important Java Distributed Computing provides a broad introduction to the problems you ll face and the solutions you ll find as you write distributed computing applications Topics covered in Java Distributed Computing Introduction to Distributed Computing Networking Basics Distributed Objects Overview of CORBA and RMI Threads Security Message Passing Systems Distributed Data Systems Databases Bandwidth Limited Applications Collaborative Systems

Progress in Distributed Operating Systems and Distributed Systems Management Wolfgang Schröder-Preikschat, 1990-05-22 The purpose of this workshop was to provide a general forum for distributed systems researchers Special emphasis was placed on research activities in distributed operating systems and management of distributed systems This volume includes a selection of the papers presented at the workshop They focus on the

illustration of existing concepts and solutions in distributed systems research and development exemplified by case study analyses of various projects The annex contains the position papers prepared for the panel discussions at the workshop

The MOSIX Distributed Operating System Amnon Barak, Shai Guday, Richard G. Wheeler, 1993 This book describes the design and internals of the MOSIX distributed operating system MOSIX an acronym for Multicomputer Operating System for UNIX integrates a cluster of loosely integrated computers into a virtual single machine UNIX environment The main property of MOSIX is the high degree of integration among the processors which may include personal workstations and shared memory and non shared memory multiprocessors connected by fast communication links This integration includes network transparency cooperation between the processors to provide services across machine boundaries support of dynamic configuration and system initiated load balancing by process migration Another property of MOSIX is the ability to scale up the system configuration to encompass a large number of computers The development of MOSIX was begun in 1981 The book is intended primarily for readers who are interested in distributed and multiprocessor systems The reader is assumed to have some knowledge in programming and operating systems preferably UNIX Readers without this background will still benefit from the techniques and algorithms discussed

Distributed Unix Systems Maurice Bach, 2001-01 Distributed Systems George F. Coulouris, Jean Dollimore, Tim Kindberg, 1994 The new edition of this bestselling title on Distributed Systems has been thoroughly revised throughout to reflect the state of the art in this rapidly developing field It emphasizes the principles used in the design and construction of distributed computer systems based on networks of workstations and server computers

A Client-server Shell Architecture for Distributed Programming Stuart Sechrest, 1988 The PPM Services provide an interface that hides many of the details of the underlying system from their clients They can be implemented on a variety of systems and their facilities used to support login sessions spanning machines running heterogeneous operating systems Distributed jobs can thus take advantage of the facilities of different systems without losing the ability to interact through a single interface A prototype of the PPM Services for UNIX 4 3BSD is described as well as the applicability of the PPM Services to other operating systems Several issues related to the design of command interpreters for distributed login sessions are discussed as well as a

description of a prototype command interpreter

Unix Based Programming Tools for Locally Distributed Network Applications William C. Frank, 1987 The Graphics and Video Laboratory of the Department of Computer Science has a growing need for easy to use programming tools in support of distributed processing applications The most pressing need is for software on three UNIX based workstations connected via Ethernet The remote interprocess communication tools that UNIX provides for using Ethernet are effective but complicated to learn This requires researchers to spend much of their time becoming proficient with them instead of concentrating on the distributed application at hand This work presents the design and implementation of several programming tools that allow programmers to establish and experiment with distributed programs in the graphics laboratory environment The tools allow a higher level of abstraction for remote interprocess communications and establish a straightforward method for implementing distributed programs Additionally they support code reuseability with software templates and are modularized to be both understandable and changeable Recommendations are made for future research and management efforts that have been highlighted by these new tools

Performance Studies of Dynamic Load Balancing in Distributed Systems University of California, Berkeley. Computer Science Division, Songnian Zhou, 1987 Distributed systems are often characterized by uneven loads on hosts and other resources In this thesis the problems concerning dynamic load balancing in loosely coupled distributed systems are studied using trace driven simulation implementation and measurement Information about job CPU and I O demands is collected from three production systems and used as input to a simulator that includes a representative CPU scheduling policy and considers the message exchange and job transfer costs explicitly A prototype load balancer is implemented in the Berkeley UNIX and Sun UNIX environments and the results of a large number of measurement experiments performed on six workstations are presented
