

Relative risk is not a probability, it is the comparison (by division) of two probabilities and so can take on any positive value (including values greater than 1).

Note: The risk for the second group may be referred to as the **base-line risk** (the risk for this group forms the denominator of the relative risk fraction).

Example

In the preceding example, comparing the risk of non-achievement for the '< 3 hours' group with the risk of non-achievement for the '≥ 3 hours' group (the base line group) gives

$$\begin{aligned} \text{relative risk} &= \frac{0.229}{0.181} && \begin{array}{l} \text{risk for } < 3 \text{ hours} \\ \text{risk for } \geq 3 \text{ hours} \end{array} \\ &= 1.27 \text{ (2 d.p.)} \end{aligned}$$

The risk of failing for the '< 3 hours' group is 1.27 times the risk of failing for the '≥ 3 hours' group.

In other words, the group of students with fewer than 3 hours preparation had a 27% higher chance of non-achievement than the group of students who studied for 3 hours or more.

Note: In reverse, the relative risk for the '≥ 3 hours' group compared with the '< 3 hours' group is $\frac{0.181}{0.229}$ or 0.79 (2 dp), so the risk of non-achievement for the '≥ 3 hours' group is 79% of the risk of non-achievement for the '< 3 hours' group.

Exercise C: Risk and relative risk

Answers
p. 226

1. A pilot study investigated if people showed some symptoms of a disease.

	No symptoms	Symptoms	Total
Male	251	44	295
Female	138	51	189
Total	389	95	484

- What proportion of people in the study showed no symptoms?

 - What proportion of people in the study who showed symptoms were female?

 - What is the risk of showing symptoms for males in this study?

 - What is the risk of showing symptoms for females in this study?

- Show that the risk of showing symptoms for people in this study is approximately one out of five.

 - Using the results from the pilot study, how many people would you expect to show symptoms of the disease if a survey was carried out on a similar group of 3 000 people?

 - Find the relative risk of showing symptoms for males compared to females.

 - Find the relative risk of showing symptoms for females compared to males.

Interpreting Basic Statistics Keith S. Cox, Zealure Holcomb, 2021-09-30 Interpreting Basic Statistics gives students valuable practice in interpreting statistical reporting as it actually appears in peer reviewed journals Features of the ninth edition Covers a broad array of basic statistical concepts including topics drawn from the New Statistics Up to date journal excerpts reflecting contemporary styles in statistical reporting Strong emphasis on data visualization Ancillary materials include data sets with almost two hours of accompanying tutorial videos which will help students and instructors apply lessons from the book to real life scenarios About this book Each of the 63 exercises in the book contain three central components 1 an introduction to a statistical concept 2 a brief excerpt from a published research article that uses the statistical concept and 3 a set of questions with answers that guides students into deeper learning about the concept The questions on the journal excerpts promote learning by helping students interpret information in tables and figures perform simple calculations to further their interpretations critique data reporting techniques and evaluate procedures used to collect data The questions in each exercise are divided into two parts 1 Factual Questions and 2 Questions for Discussion The Factual Questions require careful reading for details while the discussion questions show that interpreting statistics is more than a mathematical exercise These questions require students to apply good judgment as well as statistical reasoning in arriving at appropriate interpretations Each exercise covers a limited number of topics making it easy to coordinate the exercises with lectures or a traditional statistics textbook [Whitaker's Cumulative Book List](#), 1985
