Cardiac Dynamics J. Baan, A.C. Arntzenius, E.L. Yellin, 2012-12-06 **Cardiac Dynamics** is the name of a relatively young field of study born from the fruitful interaction between branches of two different disciplines medicine and physics Dynamics is the branch of physics which deals with the action of forces on bodies or particles in motion or at rest Cardiac relates to the clinical field of cardiology but also to cardiophysiology both of which are specialized branches of medicine Narrower than the well established field of Hemodynamics Cardiac Dynamics is restricted to dynamic phenomena occurring in and around the heart The mathematical treatment of such phenomena however is vastly more complex because of the intricate nature of the mechanisms involved in the cardiac action Thus whereas hemodynamics is concerned with predominantly passive visco elastic structures vessels containing time variant flow of viscous fluid blood the mechanical study of the heart requires additional considerations such as active elastic components representing the contractile mechanism of cardiac muscle complex geometry and fiber structure in the myocardial wall autoregulatory mechanisms and intricate flow patterns associated with valve motion Viewed in this light it is not surprising that attempts to describe ventricular pump function and to quantify contractile performance have not reached the level of sophistication which is common in e.g. arterial hemodynamics For the same reason many of the often simplified approaches to describe ventricular mechanics failed to stand up to more rigorous theoretical experimental or clinical testing
