Nutrient Metabolism and Complications of Type 2 Diabetes Mellitus Hongji Zhang,Rong Huang,Qingqing Yin,Haoqiang Zhang ,Shaohua Wang,2026-03-17 The nutrient metabolism of patients with type 2 diabetes mellitus T2DM is closely linked to diabetes related complications Nutrient metabolism disorders particularly those involving glucose cholesterol fatty acids uric acid amino acids and vitamins metabolism are not only associated with classic complications of diabetes such as diabetic cerebrovascular disease cardiovascular disease nephropathy retinopathy and peripheral neuropathy but also with potential diabetic outcomes like cognitive dysfunction abnormal bone metabolism metabolic fatty liver disease and sarcopenia Currently there is extensive research on the relationship between nutrient metabolism and classic complications and comorbidities of diabetes However studies focusing on non classical complications such as cognitive dysfunction bone metabolism abnormalities metabolic fatty liver disease and sarcopenia are still scarce Therefore there is an urgent need to delve into this under researched area specifically the relationship between nutrient metabolism and these non classical complications This relationship encompasses not only the occurrence of these complications but also their progression and key events such as dementia fractures hospitalization mortality or the progression to advanced stages of disease like the transition from metabolic fatty liver to metabolic steatohepatitis and even the development of hepatocellular carcinoma This Research Topic aims to explore the relationship between nutrient metabolism including glucose cholesterol fatty acids uric acid amino acids and vitamins metabolism and diabetic complications including above mentioned classical complications and non classical complications in various populations e g different age and genders from the perspective of clinical nutrition Special attention will be given to the less commonly recognized non classical complications in patients with T2DM We hope that these studies will shed light on the key nutrient metabolism factors

influencing patient outcomes and potentially lead to the development of appropriate intervention strategies in patients with T2DM We welcome submissions including but not limited to the following aspects The relationship between nutrient metabolism and cognitive impairment in patients with T2DM particularly its connection to mild cognitive impairment and dementia as well as the role of nutrient metabolism in the progression from mild cognitive impairment to dementia among patients with T2DM The relationship between nutrient metabolism and abnormal bone metabolism in patients with T2DM The relationship between nutrient metabolism and metabolic fatty liver disease in patients with T2DM particularly its connection to the transition from metabolic fatty liver to metabolic steatohepatitis and even the development of hepatocellular carcinoma The relationship between nutrient metabolism and sarcopenia in patients with T2DM Other classic complications of T2DM related to nutrient metabolism not yet addressed in previous studies represent an intriguing area of research

Evelyn Frias-Toral, Jorge Carriel-Mancilla, Florencia Ceriani, Almino Ramos, 2025-02-21 We are currently facing an obesity pandemic that affects individuals of all age groups geographic areas and social status among others Thus it is essential to generate high quality scientific evidence to better understand this pathology its risk factors and its treatments Several modifiable and non modifiable risk factors for the development of obesity have been identified It has been demonstrated that obese patients have an increased risk of acquiring arterial hypertension diabetes dyslipidemia cardiovascular diseases cancer and other chronic conditions In order to take efficient actions to reverse or prevent these complications it is also crucial to delve into body composition lean mass fat bone mass and sarcopenia in patients with obesity In recent months there have been developments in pharmacological therapies using GLP 1 GIP and glucagon agonists which seem to change the rules of the game regarding therapeutic decision making in these patients worldwide However surgical techniques such as sleeve gastrectomy and Roux en Y gastric bypass continue to be the most effective and definitive interventions to achieve adequate weight loss in patients with obesity Despite the pharmacological development none of the clinical trials have shown that the operated patients reach more than 30% of the total body weight as with bariatric surgery techniques Furthermore it is fundamental to analyze the impact of diverse therapeutic non surgical and non pharmacological options to address obesity such as cognitive behavioral interventions and different types of diets in combination with physical activity
