**Structural Sensitivity Analysis and Optimization 1** Kyung K. Choi, Nam-Ho Kim, 2006-12-30 Structural design sensitivity analysis concerns the relationship between design variables available to the design engineer and structural responses determined by the laws of mechanics The dependence of response measures such as displacement stress strain natural frequency buckling load acoustic response frequency response noise vibration harshness NVH thermo elastic response and fatigue life on the material property sizing component shape and configuration design variables is defined through the governing equations of structural mechanics In this 2 volume set first and second order design sensitivity analyses are presented for static and dynamics responses of both linear and nonlinear elastic structural systems including elasto plastic and frictional contact problems Book I introduces structural design concepts that include the CAD based design model design parameterization performance measures costs and constraints It also discusses design sensitivity analysis of linear structural systems and discrete and continuum design sensitivity analysis methods

**Method** Mangesh Shrikant Edke,2009 Shape Design Sensitivity Analysis and Optimization Using the Boundary Element Method Zhiye Zhao,1991-02-28 This book investigates the various aspects of shape optimization of two dimensional continuum structures including shape design sensitivity analysis structural analysis using the boundary element method BEM and shape optimization implementation The book begins by reviewing the developments of shape optimization followed by the presentation of the mathematical programming methods for solving optimization problems The basic theory of the BEM is presented which will be employed later on as the numerical tool to provide the structural responses and the shape design sensitivities The key issue of shape optimization the shape design sensitivity analysis is fully investigated A general formulation of stress sensitivity using the continuum approach is presented The difficulty of the modelling of the adjoint problem is studied and two approaches are presented for the modelling of the adjoint problem The first approach uses distributed loads to smooth the concentrated adjoint loads and the second approach employs the singularity subtraction method to remove the singular boundary displacements and tractions from the BEM equation A novel finite difference based approach to shape design sensitivity is presented which overcomes the two drawbacks of the conventional finite difference method This approach has the advantage of being simple in concept and easier implementation A shape optimization program for two dimensional continuum structures is developed including structural analysis using the BEM shape design sensitivity analysis mathematical programming and the design boundary modelling
