Differential Geometry of Curves and Surfaces with Mathematica Elsa Abbena,Simon Salamon,Alfred Gray,2017-09-06
Presenting theory while using Mathematica in a complementary way *Modern Differential Geometry of Curves and Surfaces with Mathematica* the third edition of Alfred Gray s famous textbook covers how to define and compute standard geometric functions using Mathematica for constructing new curves and surfaces from existing ones Since Gray s death authors Abbena and Salamon have stepped in to bring the book up to date While maintaining Gray s intuitive approach they reorganized the material to provide a clearer division between the text and the Mathematica code and added a Mathematica notebook as an appendix to each chapter They also address important new topics such as quaternions The approach of this book is at times more computational than is usual for a book on the subject For example Brioshi s formula for the Gaussian curvature in terms of the first fundamental form can be too complicated for use in hand calculations but Mathematica handles it easily either through computations or through graphing curvature Another part of Mathematica that can be used effectively in differential geometry is its special function library where nonstandard spaces of constant curvature can be defined in terms of elliptic functions and then plotted Using the techniques described in this book readers will understand concepts geometrically plotting curves and surfaces on a monitor and then printing them Containing more than 300 illustrations the book demonstrates how to use Mathematica to plot many interesting curves and surfaces Including as many topics of the classical differential geometry and surfaces as possible it highlights important theorems with many examples It includes 300 miniprograms for computing and plotting various geometric objects alleviating the drudgery of computing things such as the curvature and torsion of a curve in space

Subject Guide to Books in Print ,2001 *Modern Differential Geometry of Curves and Surfaces with Mathematica, Second Edition* mary Gray,1997-12-29 The Second Edition combines a traditional approach with the symbolic manipulation abilities of Mathematica to explain and develop the classical theory of curves and surfaces You will learn to reproduce and study interesting curves and surfaces many more than are included in typical texts using computer methods By plotting geometric objects and studying the printed result teachers and students can understand concepts geometrically and see the effect of changes in parameters *Modern Differential Geometry of Curves and Surfaces with Mathematica* explains how to define and compute standard geometric functions for example the curvature of curves and presents a dialect of Mathematica for constructing new curves and surfaces from old The book also explores how to apply techniques from analysis Although the book makes extensive use of Mathematica readers without access to that program can perform the calculations in the text by hand While single and multi variable calculus some linear algebra and a few concepts of point set topology are needed to understand the theory no computer or Mathematica skills are required to understand the concepts presented in the text In fact it serves as an excellent introduction to Mathematica and includes fully documented

programs written for use with Mathematica Ideal for both classroom use and self study Modern Differential Geometry of Curves and Surfaces with Mathematica has been tested extensively in the classroom and used in professional short courses throughout the world
