

Is Stimulus Sampling Theory a Model?

- “The term ‘stimulus sampling theory’ refers to a number of theories differing with respect to special assumptions and their mathematical expression, yet sharing a common approach to conceptual representation of the stimulus situation and the formation of associative connections, rather than to a single coherent set of assumptions formulated to apply to all the experimental procedures employed in the study of learning” (p. 1).

behavior of rats in a T maze With the addition of new routines to specify the simulated environment of the simulated organism a similar basic program has learned to discriminate among visual patterns consisting of carelessly hand drawn alphabetic characters each of which is presented in a number of variations Input to the program is a binary representation of the presence or absence of parts of the figure in a 20 x 20 matrix superimposed on the figure to be recognized Each cell of the matrix is treated as a separate stimulus having various numbers of elements as associated with all the responses that can be made A random sample of elements from stimuli present in the visual field is used to determine the response any trial When a correct response is made all elements sampled on that trial become associated with that response Changes in learning rates occur as the probability of selecting available stimulus elements is changed Learning, Memory, and Conceptual Processes Walter Kintsch,1970 Human Memory: Theory and Data Bennet Bronson Murdock,1974
