Mendelian Randomization: An Approach for Precision Medicine and Public Health Triinu Peters, Xiaoqing Pan, Yi-Ju Li, Jiayue-Clara Jiang, 2025-04-24 Epidemiological studies have established various observational associations between modifiable human behaviors and disease risk However observational studies are prone to unmeasured confounding bias and cannot establish causal associations which are important to investigate disease treatment

and drug development In 1991 Gray and Wheatley proposed the term Mendelian Randomization a method that were applied to obtain unbiased estimations of the impact of cancer treatment within a family based design The term has since been applied to describe statistical genomic studies that used genetic instruments as proxy for modifiable risk factors or behaviors to infer causal association with diseases The principle of Mendelian Randomization relies on Mendel s laws of inheritance and random segregation It is less prone to unmeasured confounding bias and reverse causation compared to observational studies and can be applied to address questions of causality without any typical bias that impact the validity of traditional epidemiological methods Studies based on Mendelian Randomization have become more conventional with the enhancement of genome wide association studies GWAS and genome sequencing technologies These methods have the potential to reveal the aetiological importance of environmental casual factors in common chronic diseases with minimal influence of confounding reverse causation and various other sources of bias
