disease and other aging related movement disorders are widespread in the elderly with relatively unideal medicine treatment effects In recent years deep brain stimulation DBS has been established as an effective treatment for PD and other aging related movement disorders especially with motor symptoms However there are still many problems to be solved in research work and clinical practice in this field For example it is unclear regarding the most effective stimulation targets or the underlying mechanism of DBS And it is still unknown how to choose the optimal targets among STN GPi PSA VIM etc or if we could choose the nerve fiber for stimulation besides the nuclei And despite wearable sensors could be a powerful tool for the digital evaluation of movement disorders or provide the feedback biomarkers for DBS the closed loop biomarkers for DBS are still lacking Furthermore apart from PD the DBS treatment in gene related dystonia Huntington s disease and other movement disorders also needs to be further explored
