Rozovskii,2012-12-06 The study of the ocean is almost as old as the history of mankind itself When the first seafarers set out in their primitive ships they had to understand as best they could tides and currents eddies and vortices for lack of understanding often led to loss of life These primitive oceanographers were of course primarily statisticians They collected what empirical data they could and passed it down initially by word of mouth to their descendants Data collection continued throughout the millenia and although data bases became larger more reliable and better codified it was not really until surprisingly recently that mankind began to try to understand the physics behind these data and shortly afterwards to attempt to model it The basic modelling tool of physical oceanography is today the partial differential equation Somehow we all know that if only we could find the right set of equations with the right initial and boundary conditions then we could solve the mysteries of ocean dynamics once and for all *Stochastic Transport in Upper Ocean Dynamics II* Bertrand Chapron,Dan Crisan,Darryl Holm,Etienne Mémin,Anna Radomska,2023-10-03 This open access proceedings volume brings selected peer reviewed contributions presented at the Third Stochastic Transport in Upper Ocean Dynamics STUOD 2022 Workshop held virtually and in person at the Imperial College London UK September 26 29 2022 The STUOD project is supported by an ERC Synergy Grant and led by Imperial College London the National Institute for Research in Computer Science and Automatic Control INRIA and the French Research Institute for Exploitation of the Sea IFREMER The project aims to deliver new capabilities for assessing variability and uncertainty in upper ocean dynamics It will provide decision makers a means of quantifying the effects of local patterns of sea level rise heat uptake carbon storage and change of oxygen content and pH in the ocean Its multimodal monitoring will enhance the scientific understanding of marine debris transport tracking of oil spills and accumulation of plastic in the sea All topics of these proceedings are essential to the scientific foundations of oceanography which has a vital role in climate science Studies convened in this volume focus on a range of fundamental areas including Observations at a high resolution of upper ocean properties such as temperature salinity topography wind waves and velocity Large scale numerical simulations Data based stochastic equations for upper ocean dynamics that quantify simulation error Stochastic data assimilation to reduce uncertainty These fundamental subjects in modern science and technology are urgently required in order to meet the challenges of climate change faced today by human society This proceedings volume represents a lasting legacy of crucial scientific expertise to help meet this ongoing challenge for the benefit of academics and professionals in pure and applied mathematics computational science data analysis data assimilation and oceanography *Stochastic Transport in Upper Ocean Dynamics III* Bertrand Chapron,Dan Crisan,Darryl D. Abramov, Marcus J. Grote, 2005 This book introduces mathematicians to the fascinating mathematical interplay between ideas from stochastics and information theory and practical issues in studying complex multiscale nonlinear systems It emphasizes the serendipity between modern applied mathematics and applications where rigorous analysis the development of qualitative and or asymptotic models and numerical modeling all interact to explain complex phenomena After a brief introduction to the emerging issues in multiscale modeling the book has three main chapters The first chapter is an introduction to information theory with novel applications to statistical mechanics predictability and Jupiter s Red Spot for geophysical flows The second chapter discusses new mathematical issues regarding fluctuation dissipation theorems for complex nonlinear systems including information flow various approximations and illustrates applications to various mathematical models The third chapter discusses stochastic modeling of complex nonlinear systems After a general discussion a new elementary model motivated by issues in climate dynamics is utilized to develop a self contained example of stochastic mode reduction Based on A Majda s Aisenstadt lectures at the University of Montreal the book is appropriate for both pure and applied mathematics graduate students postdocs and faculty as well as interested researchers in other scientific disciplines No background in geophysical flows is required About the authors Andrew Majda is a member of the National Academy of Sciences and has received numerous honors and awards including the National Academy of Science Prize in Applied Mathematics the John von Neumann Prize of the Society of Industrial and Applied Mathematics the Gibbs

Prize of the American Mathematical Society and the Medal of the College de France In the past several years at the Courant Institute Majda and a multi disciplinary faculty have created the Center for Atmosphere Ocean Science to promote cross disciplinary research with modern applied mathematics in climate modeling and prediction R V Abramov is a young researcher he received his PhD in 2002 M J Grote received his Ph D under Joseph B Keller at Stanford University in 1995
