Variational Mechanics and Stochastic Methods Applied to Structural Design Rabindranath Andújar, 2014 This thesis explores a very well understood area of physics computational structural dynamics The aim is to stretch its boundaries by merging it with another very well established discipline such as structural design and optimization In the recent past both of them have made significant advances often unaware one of each other for different reasons It is the aim of this thesis to serve as a bridging tool between the realms of physics and engineering The work is divided in three parts variational mechanics structural optimization and implementation The initial part deals with deterministic variational mechanics Two chapters are dedicated to probe the applicability of energy functionals in the structural analysis First by mapping the state of the art regarding the vast field of numerical methods for structural dynamics second by using those functionals as a tool to compare the methods It is shown how once the methods are grouped according to the kind of differential equations they integrate it is easy to establish a framework for benchmarking Moreover if this comparison is made using balance of energy the only parameter needed to observe is a relatively easy to obtain scalar value The second part where structural optimization is treated has also two chapters In the first one the nondeterministic tools employed by structural designers are presented and examined An important distinction between tools for optimization and tools for analysis is highlighted In the following chapter a framework for the objective characterization of structural systems is developed This characterization is made on the basis of the thermodynamics and energetic characteristics of the system Finally it is successfully applied to drive a sample simulated annealing algorithm In the third part the resulting code

employed in the numerical experiments is shown and explained This code was developed by means of a visual programming environment and allows for the fast Implementation of programs within a consolidated CAD application It was used to interconnect simultaneously with other applications to seamlessly share simulation data and process it Those applications were respectively a spreadsheet and a general purpose finite element

Probabilistic Structural Dynamics Yu-Kweng Lin, Guo-Qiang Cai, 1995 This book offers readers a balanced exposition of both the mathematical theory of stochastic processes and the principle of structural mechanics It begins with a comprehensive discussion of linear structures under additive random excitations within the frameworks of spectral analysis evolutionary spectral analysis and the theory of random pulse train This is then followed by a thorough treatment of Markov processes including the justification of the Markov idealization from a physical point of view and the solution techniques when applied to model a nonlinear dynamical system under additive random excitations multiplicative random excitations or both Approximately on half of the book deals with such advanced topics as motion stability of dynamical systems due to multiplicative excitations failures due to the excursion of the system response into unsafe regions and random uncertainties of system parameters and initial conditions The authors have taken special care to keep the development of mathematical principles challenging and yet comprehensive to any reader with a sound background in mechanics The inclusion of many examples in earthquake and wind engineering also makes the book a desirable reference for interested researchers in these areas

dynamics *Computational Methods in Stochastic Dynamics* Manolis Papadrakakis, George Stefanou, Vissarion Papadopoulos, 2012-09-26 The considerable influence of inherent uncertainties on structural behavior has led the engineering community to recognize the importance of a stochastic approach to structural problems. Issues related to uncertainty quantification and its influence on the reliability of the computational models are continuously gaining in significance. In particular, the problems of dynamic response analysis and reliability assessment of structures with uncertain system and excitation parameters have been the subject of continuous research over the last two decades as a result of the increasing availability of powerful computing resources and technology. This book is a follow up of a previous book with the same subject ISBN 978 90 481 9986 0 and focuses on advanced computational methods and software tools which can highly assist in tackling complex problems in stochastic dynamic seismic analysis and design of structures. The selected chapters are authored by some of the most active scholars in their respective areas and represent some of the most recent developments in this field. The book consists of 21 chapters which can be grouped into several thematic topics including dynamic analysis of stochastic systems, reliability based design, structural control and health monitoring, model updating, system identification, wave propagation in random media, seismic fragility analysis and damage assessment. This edited book is primarily intended for researchers and post graduate students who are familiar with the fundamentals and wish to study or to advance the state of the art on a particular topic in the field of computational stochastic structural dynamics. Nevertheless, practicing engineers could benefit as well from it as most code provisions tend to incorporate probabilistic concepts in the analysis and design of structures.

Nonlinear Stochastic Dynamic Engineering Systems Franz Ziegler, Gerhard I. Schueller, 2012-12-06 This symposium held at Innsbruck IGLS on June 21-26 1987 is the fifth in a series of IUTAM Symposia on the application of stochastic methods in mechanics. The first two meetings in Warwick 1972 and Southampton 1976 concentrated on the stability of stochastic dynamical systems and stochastic methods in dynamics respectively. The third meeting in Frankfurt Oder 1982 added aspects of reliability while the fourth symposium in Stockholm 1984 dealt mainly with fatigue and fracture problems. The general theme of the present symposium is devoted to nonlinear stochastic dynamics of engineering systems which is believed of great importance for providing the tools for basic development and progress in various fields of mechanical, structural and aeronautical engineering particularly in the areas of vehicle dynamics, multi storey structural dynamics, systems identification, offshore structural dynamics, nuclear structures under various stochastic loading conditions i.e. wind, earthquake, parametric excitations etc. The contributions collected in this volume cover a wide spectrum of topics ranging from more theoretical, analytical and numerical treatment to practical application in various fields. The truly international character of the meeting is accomplished by 42 contributions and 86 participants from as many as 19 countries and hence contributed to the original idea of IUTAM which is to foster international cooperation. It should be recalled that for getting this cooperation started again after the First World War Theodore von Karman and Tullio Levi Civita called the world
