*Dr. Dobb's Journal* ,1996 *State of the Art in Computer Graphics* David F. Rogers,Rae Earnshaw,1991-06-03 Today one of the hardest parts of computer aided design or analysis is first modeling the design then recording and verifying it For example a typical vehicle such as a tank automobile ship or aircraft might be composed of tens of thousands of individual parts Many of these parts are composed of cylinders flats and simple conic curves and surfaces such as are amenable to modeling using a constructive solid geometry CSG approach However especially with the increasing use of composite materials many parts are designed using sculptured surfaces A marriage of these two techniques is now critical to continued development of computer aided design and analysis Further the graphical user interfaces used in most modeling systems are at best barely adequate to the required task Critical work on these interfaces is required to continue pushing back the frontiers Similarly once the design is modeled how are the varied and diverse pieces stored retrieved and modified How are physical interferences prevented or eliminated Although considerable progress has been made there are still more questions and frustrations than answers One of the fundamental problems of the 1990s is and will continue to be modeling The second problem is interpretation With the ever increasing computational power available our ability to generate data far exceeds our ability to interpret understand and utilize that data
