Stochastic Local Search Foundations And Applications:

Stochastic Local Search Holger H. Hoos, Thomas Stützle, 2005 Stochastic local search SLS algorithms are among the most prominent and successful techniques for solving computationally difficult problems Offering a systematic treatment of SLS algorithms this book examines the general concepts and specific instances of SLS algorithms and considers their development analysis and application

Stochastic Local Search Thomas Stützle, Holger H. Hoos, 2003 Stochastic local search, 2004

Stochastic Local Search - Methods, Models, Applications Holger Hoos, 1999 To date stochastic local search SLS algorithms are among the standard methods for solving hard combinatorial problems from various areas of Artificial Intelligence and Operations Research Some of the most successful and powerful algorithms for prominent problems like SAT CSP or TSP are based on stochastic local search This work investigates various aspects of SLS algorithms in particular it focusses on modelling these algorithms empirically evaluating their performance characterising and improving their behaviour and understanding the factors which influence their efficiency These issues are studied for the SAT problem in propositional logic as a primary application domain SAT has the advantage of being conceptually very simple which facilitates the design implementation and presentation of algorithms as well as their analysis However most of the methodology generalises easily to other combinatorial problems like CSP This Ph D thesis won the Best Dissertation Award 1999 Dissertationspreis of the German Informatics Society Gesellschaft für Informatik

Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18

Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this

handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

Handbook of Approximation Algorithms and Metaheuristics Teofilo F. Gonzalez, 2018-05-15 Handbook of Approximation Algorithms and Metaheuristics Second Edition reflects the tremendous growth in the field over the past two decades Through contributions from leading experts this handbook provides a comprehensive introduction to the underlying theory and methodologies as well as the various applications of approximation algorithms and metaheuristics Volume 1 of this two volume set deals primarily with methodologies and traditional applications It includes restriction relaxation local ratio approximation schemes randomization tabu search evolutionary computation local search neural networks and other metaheuristics It also explores multi objective optimization reoptimization sensitivity analysis and stability Traditional applications covered include bin packing multi dimensional packing Steiner trees traveling salesperson scheduling and related problems Volume 2 focuses on the contemporary and emerging applications of methodologies to problems in combinatorial optimization computational geometry and graphs problems as well as in large scale and emerging application areas It includes approximation algorithms and heuristics for clustering networks sensor and wireless communication bioinformatics search streams virtual communities and more About the Editor Teofilo F Gonzalez is a professor emeritus of computer science at the University of California Santa Barbara He completed his Ph D in 1975 from the University of Minnesota He taught at the University of Oklahoma the Pennsylvania State University and the University of Texas at Dallas before joining the UCSB computer science faculty in 1984 He spent sabbatical leaves at the Monterrey Institute of Technology and Higher Education and Utrecht University He is known for his highly cited pioneering research in the hardness of approximation for his sublinear and best possible approximation algorithm for k tMM clustering for introducing the open shop scheduling problem as well as algorithms for its solution that have found applications in numerous research areas as well as for his research on problems in the areas of job scheduling graph algorithms computational geometry message communication wire routing etc

Theory and Applications of Satisfiability Testing – SAT 2008 Hans Kleine Büning, Zhao Xishun, 2008-04-25 This volume contains the papers presented at the 11th International Conference on Theory and Applications of Satisfiability Testing SAT 2008 The series of International Conferences on Theory and Applications of Satisfiability Testing SAT has evolved from a first workshop on SAT in 1996 to an

annual international conference which is a platform for researchers studying various aspects of the propositional satisfiability problem and its applications. In the past the SAT conference venue alternated between Europe and North America. For the first time the conference venue was in Asia, more precisely at the Zhudao Guest House near Sun Yat Sen University in Guangzhou, P. R. China. Many hard combinatorial problems can be encoded into SAT. Therefore, improvements on heuristics on the practical side, as well as theoretical insights into SAT, apply to a large range of real world problems. More specifically, many important practical verification problems can be rephrased as SAT problems. This applies to verification problems in hardware and software. Thus SAT is becoming one of the most important core technologies to verify secure and dependable systems. The topics of the conference span practical and theoretical research on SAT and its applications and include but are not limited to: proof systems, proof complexity, search algorithms, heuristics, analysis of algorithms, hard instances, randomized formulae, problem encodings, industrial applications, solvers, splitters, tools, case studies, and empirical results. SAT is interpreted in a rather broad sense; besides propositional satisfiability, it includes, for example, the main of quantified Boolean formulae (QBF) and satisfiability modulo theories (SMT).

Theory and Applications of Satisfiability Testing - SAT 2009 Oliver Kullmann, 2009-06-19. This book constitutes the refereed proceedings of the 12th International Conference on Theory and Applications of Satisfiability Testing SAT 2009, held in Swansea, UK, in June/July 2009. The 34 revised full papers presented together with 11 revised short papers and 2 invited talks were carefully selected from 86 submissions. The papers are organized in topical sections on: applications of SAT, complexity theory, structures for SAT, resolution and SAT translations to CNF, techniques for conflict-driven SAT, Solvers, solving SAT by local search, hybrid SAT solvers, automatic adaptation of SAT solvers, stochastic approaches to SAT, solving QBFs and their representations, optimization algorithms, distributed and parallel solving.

A Methodology for the Cryptanalysis of Classical Ciphers with Search Metaheuristics George Lasry, 2018. Cryptography, the art and science of creating secret codes and cryptanalysis, the art and science of breaking secret codes, underwent a similar and parallel course during history. Both fields evolved from manual encryption methods and manual codebreaking techniques to cipher machines and codebreaking machines in the first half of the 20th century and finally to computer-based encryption and cryptanalysis from the second half of the 20th century. However, despite the advent of modern computing technology, some of the more challenging classical cipher systems and machines have not yet been successfully cryptanalyzed. For others, cryptanalytic methods exist but only for special and advantageous cases, such as when large amounts of ciphertext are available. Starting from the 1990s, local search metaheuristics such as hill climbing, genetic algorithms, and simulated annealing have been employed and, in some cases, successfully for the cryptanalysis of several classical ciphers. In most cases, however, results were mixed and the application of such methods rather limited in their scope and performance. In this work, a robust framework and methodology for the cryptanalysis of classical ciphers using local search metaheuristics, mainly hill climbing and simulated annealing, is described. In an extensive set of case studies conducted as part of this research, this new

methodology has been validated and demonstrated as highly effective for the cryptanalysis of several challenging cipher systems and machines which could not be effectively cryptanalyzed before and with drastic improvements compared to previously published methods This work also led to the decipherment of original encrypted messages from WWI and to the solution for the first time of several public cryptographic challenges

Unconventional Computation Selim G. Akl, Cristian S. Calude, Michael J. Dinneen, Grzegorz Rozenberg, H. Todd Wareham, 2007-08-23 There is a world beyond Turing as more and more computer researchers are demonstrating but where would you find out about the current leading edge in unconventional computation Here in this fascinating work that is the refereed proceedings of the 6th International Conference on Unconventional Computation held in Kingston Canada in August 2007 The 17 revised full papers presented together with 4 invited papers were carefully reviewed and selected for inclusion in the book All current aspects of unconventional computation are addressed

Evolutionary Multi-Agent Systems Aleksander Byrski, Marek Kisiel-Dorohinicki, 2016-12-21 This book addresses agent based computing concentrating in particular on evolutionary multi agent systems EMAS which have been developed since 1996 at the AGH University of Science and Technology in Cracow Poland It provides the relevant background information on and a detailed description of this computing paradigm along with key experimental results Readers will benefit from the insightful discussion which primarily concerns the efficient implementation of computing frameworks for developing EMAS and similar computing systems as well as a detailed formal model Theoretical deliberations demonstrating that computing with EMAS always helps to find the optimal solution are also included rounding out the coverage
