Organic Computing – A Paradigm Shift for Complex Systems Christian Müller-Schloer, Hartmut Schmeck, Theo Ungerer, 2011-04-29 Organic Computing has emerged as a challenging vision for future information processing systems Its basis is the insight that we will increasingly be surrounded by and depend on large collections of autonomous systems which are equipped with sensors and actuators aware of their environment communicating freely and organising themselves in order to perform actions and services required by the users These networks of intelligent systems surrounding us open fascinating application areas and at the same time bear the problem of their controllability Hence we have to construct such systems as robust safe flexible and trustworthy as possible In particular a strong orientation towards human needs as opposed to a pure implementation of the technically possible seems absolutely central The technical systems which can achieve these goals will have to exhibit life like or organic properties Organic Computing Systems adapt dynamically to their current environmental conditions In order to cope with unexpected or undesired events they are self organising self configuring self optimising self healing self protecting self explaining and context aware while offering complementary interfaces for higher level directives with respect to the desired behaviour First steps towards adaptive and self organising computer systems are being undertaken Adaptivity reconfigurability emergence of new properties and self organisation are hot topics in a variety of research groups worldwide This book summarises the results of a 6 year priority research program SPP of the German Research Foundation DFG addressing these fundamental challenges in the design of Organic Computing systems It presents and discusses the theoretical foundations of Organic Computing basic methods and tools learning techniques used in this context architectural patterns and many applications The final outlook shows that in the mean time Organic Computing ideas have spawned a variety of promising new projects

Design of Reservation Protocols for Multimedia Communication Luca Delgrossi, 2012-12-06 The advent of multimedia technology is creating a number of new problems in the fields of computer and communication systems Perhaps the most important of these problems in communication and certainly the most interesting is that of designing networks to carry multimedia traffic including digital audio and video with acceptable quality The main challenge in integrating the different services needed by the different types of traffic into the same network an objective that is made worthwhile by its obvious

economic advantages is to satisfy the performance requirements of continuous media applications as the quality of audio and video streams at the receiver can be guaranteed only if bounds on delay jitter bandwidth and reliability are guaranteed by the network Since such guarantees cannot be provided by traditional packet switching technology a number of researchers and research groups during the last several years have tried to meet the challenge by proposing new protocols or modifications of old ones to make packet switching networks capable of delivering audio and video with good quality while carrying all sorts of other traffic The focus of this book is on HeiTS the Heidelberg Transport System and its contributions to integrated services network design The HeiTS architecture is based on using the Internet Stream Protocol Version 2 ST II at the network layer The Heidelberg researchers were the first to implement ST II The author documents this activity in the book and provides thorough coverage of the improvements made to the protocol The book also includes coverage of HeiTP as used in error handling error control congestion control and the full specification of ST2 a new version of ST II The ideas and techniques implemented by the Heidelberg group and their coverage in this volume apply to many other approaches to multimedia networking
