Speech Processing In The Auditory System:

Speech Processing in the Auditory System Steven Greenberg, William A. Ainsworth, Richard R. Fay, 2006-05-09 Although speech is the primary behavioral medium by which humans communicate its auditory basis is poorly understood having profound implications on efforts to ameliorate the behavioral consequences of hearing impairment and on the development of robust algorithms for computer speech recognition In this volume the authors provide an up to date synthesis of recent research in the area of speech processing in the auditory system bringing together a diverse range of scientists to present the subject from an interdisciplinary perspective Of particular concern is the ability to understand speech in uncertain potentially adverse acoustic environments currently the bane of both hearing aid and speech recognition technology There is increasing evidence that the perceptual stability characteristic of speech understanding is due at least in part to elegant transformations of the acoustic signal performed by auditory mechanisms As a comprehensive review of speech s auditory basis this book will interest physiologists anatomists psychologists phoneticians computer scientists biomedical and electrical engineers and clinicians Speech Processing in the Auditory System Steven Greenberg, William A. Listening to Speech Steven Greenberg, William Ainsworth, 2012-12-06 The human species is largely defined by its use of spoken language so integral is speech communication to behavior and social interaction Despite its importance in everyday life comparatively little is known about the auditory mechanisms that underlie the ability to understand language The current volume examines the perception and processing of speech from the perspective of the hearing system The chapters in this book describe a comprehensive set of approaches to the scientific study of speech and hearing ranging from anatomy and physiology to psychophysics and perception and computational modeling The auditory basis of speech is examined within a biological and an evolutionary context and its relevance to applied domains such as communication disorders and speech technology discussed in detail This volume will be of interest to scientists engineers and clinicians whose professional work pertains to any aspect of spoken language or hearing science The Perception of Speech Brian Moore, Lorraine

Tyler, William Marslen-Wilson, 2009-11-12 Humans are unique in being able to convey such complex information using speech and in the range of ideas thoughts and emotions that can be expressed This crossdisciplinary book explores how the motor gestures of a speaker are transformed to sounds and how those are mapped onto meaning in the comprehension of spoken language **Auditory Perception of Speech** Derek A. Andrew Cameron Morris, 1992 Mechanisms of Speech Recognition W. A. Ainsworth, 2014-05-18 Mechanisms of Speech Recognition explores the mechanisms underlying speech recognition Topics covered include the auditory system speech production auditory psychophysics speech synthesis and analysis vowel and consonant recognition and perception of

prosodic features and of distorted speech Automatic speech recognition and models of speech recognition are also given consideration This volume consists of 11 chapters and begins with an overview of speech recognition communication and production More specifically it examines the way in which the organs of the vocal apparatus are employed to transform a message consisting of a string of linguistic units such as words or phonemes into a wave of continuous sounds which are recognized as speech The auditory system and its parts are then described from the ears to the organ of Corti and nerve cells The chapters that follow focus on the behavior of the hearing system the various techniques of analyzing speech sounds and speech synthesizers such as vocoders The mechanisms underlying the recognition of vowels and consonants are also described along with the physical parameters of the speech wave which signal the prosody of an utterance the effects of distortions in the speech wave on speech perception and tools used in automatic speech recognition The book concludes with an evaluation of models of speech recognition This book will be of interest to phoneticians linguists physiologists psychologists and physicists [Biomedical Index to PHS-supported Research: pt. Analysis and Modeling of Neural Systems Frank H. Eeckman, 1992 The recent explosion of activity in neural modeling seems to have been driven more by advances in the theories and applications of learning paradigms for artificial neural networks than by advances in our knowledge of real nervous systems In the past few years major conferences on neural networks and neural modeling have emerged and appropriately have focussed on technological exploitation of these advances Sensing that the recent leaps in both computational power and knowledge of the nervous system may have set the stage for a revolution in theoretical neurobiology neuroscientists have welcomed the new neural modeling but many of them would like to see it directed as heavily toward understanding of the nervous system as it is presently directed toward computer technology and control system engineering Furthermore some neuroscientists believe that technologists should not be satisfied only with exploiting or extending the recent advances in learning paradigms that emerging knowledge about real nervous systems will suggest other comparably valuable paradigms for signal processing and control Our motive as organizers was to have a conference that focussed on both of these areas emerging modeling tools and concepts for neurobiologists and emerging neurobiological concepts and neurobiological knowledge of potential use to technologists Our principle of design was simple

We attempted to organize a conference with a group of speakers that would be most illuminating and exciting to us and to our students. We succeeded. Edwin R. Lewis

INTRODUCTION This volume contains the collected papers of the 1990 Conference on Analysis and Modeling of Neural Systems held July 25-27 in Berkeley, California. There were 21 invited talks at the meeting covering aspects of analysis and modeling from the subcellular level to the network level. In addition, thirty-six posters were accepted for presentation.

The Cognitive Representation of Speech T. Myers, J. Laver, J. Anderson, 1981-12-01 The 32 main papers taken together provide a comprehensive review of speech research by scientists who have made leading contributions to our understanding of the topics discussed. The papers are assembled within a coherent problem-oriented structure.

Auditory Spectral Processing Manuel S. Malmierca, Dexter R. F. Irvine, 2005-11-23 All natural auditory signals including human speech and animal communication signals are spectrally and temporally complex; that is, they contain multiple frequencies and their frequency composition or spectrum varies over time. The ability of hearers to identify and localize these signals depends on analysis of their spectral composition. For the overwhelming majority of human listeners, spoken language is the major means of social communication, and this communication therefore depends on spectral analysis. Spectral analysis begins in the cochlea but is then elaborated at various stages along the auditory pathways in the brain that lead from the cochlea to the cerebral cortex. The broad purpose of Auditory Spectral Processing is to provide a comprehensive account of the way in which spectral information is processed in the brain and the way in which this information is used by listeners to identify and localize sounds. Examines spectral processing mechanisms at different levels along the auditory neuraxis from the cochlear nucleus to the cortex. Reviews in detail psychophysical and neurophysiological evidence on the way in which spectral information is processed within and across frequency channels. Presents information on the nature of the spectral information required for speech and music perception. Examines a series of issues that relate to the role of spectral analysis in higher-order cognitive aspects of hearing and in clinical and applied contexts.
