Abstract

Background: New blood products are considered for treatment of patients with major hemorrhage. The aim of this report is to describe the current transfusion practices in Europe for patients with major hemorrhage and explore the need for new or modified blood products to ensure prehospital and in-hospital blood supply.

Study Design and Method: The European Blood Alliance (EBA) Working Group on Innovation and New Blood Products' subgroup on major hemorrhage performed a survey among the EBA member states.

Results: The response rate was 58% (17 responses from 15 of the 26 EBA member states). Of these, sixteen (94%) provide massive transfusion packages (MTPs) with balanced ratio of red blood cells and plasma. Seven of the respondents included platelets from the start of treatment. Eleven (65%) provide prehospital blood products, mainly red cell concentrates or dried and/or thawed plasma with 5 days of extended storage. Two countries provide prehospital whole blood. Twelve respondents (71%) saw a need for implementation of new or modified blood components in their institution. The top three priorities were whole blood (12 of 12, 100%), dried plasma (8 of 12, 67%), and cold-stored platelets (7 of 12, 58%).

Discussion: Current national guidelines for use of blood products in patients with major hemorrhage in Europe agree on the use of balanced transfusion, however the timing and source of platelets differ. Blood products for prehospital transfusion are available in several European countries. An interest in new or modified blood products for patients with major hemorrhage was observed, especially for whole blood.

Advances in Transfusion Safety Girish N. Vyas, Fred Brown, University of California School of Medicine, San Francisco, 2000 Our current understanding of the molecular mechanisms underlying host parasite interaction in the establishment of persistent infections transmitted through blood transfusion permits us to develop strategies for their prevention Because of rigorous screening to prevent transmission of blood borne infections the transfusion of blood and blood products has already achieved an unprecedented level of safety The window period viraemia can be further reduced by screening donated blood with nucleic acid testing NAT technology now being introduced in Europe and the U S A Both immunological and virological risks of transfusion can be reduced by photodecontamination and universal leukofiltration performed at the blood processing facilities Unquestionably progressive improvements in transfusion safety leads to an escalation in the cost of our blood supply therefore cost effectiveness quality control and regulatory issues have become topics of considerable importance in responding to our society's expectation of risk free hemotherapy Transfusion Medicine: Quo Vadis?
