Video analytics is intended to solve the problem of the incapability of exploiting video streams in real time for the purpose of detection or anticipation. It involves analyzing the videos using algorithms that detect and track objects of interest over time and that indicate the presence of events or suspect behavior involving these objects. The aims of this book are to highlight the operational attempts of video analytics to identify possible driving forces behind potential evolutions in years to come and above all to present the state of the art and the technological hurdles which have yet to be overcome. The need for video surveillance is introduced through two major applications the security of rail transportation systems and a posteriori investigation. The characteristics of the videos considered are presented through the cameras which enable capture and the compression methods which allow us to transport and store them. Technical topics are then discussed the analysis of objects of interest detection tracking and recognition high level video analysis which aims to give a semantic interpretation of the observed scene events behaviors types of content. The book concludes with the problem of performance evaluation. *Intelligent Network Video*, 2008-09-10
