Theoretical Aspects of Neural Computation: A Multidisciplinary Perspective Kwok-Yee M. Wong, Dit-Yan Yeung, 1998-06 Over the past decade or so neural computation has emerged as a research area with active involvement by researchers from a number of different disciplines including computer science engineering mathematics neurobiology physics and statistics The workshop brought together researchers with a diverse background to review the current status of neural computation research Three aspects of neural computation have been emphasized neuroscience aspects computational and Mathematical aspects and statistical physics aspects This book contains 28 contributions from frontier researchers in these fields Thoroughly re edited and in some cases revised post workshop these papers collated into this review volume provide a top class reference summary of the state of the art work done in this field *Connectionism in Perspective* R. Pfeifer, Z. Schreter, F. Fogelman-Soulié, L. Steels, 1989-08-23 An evaluation of the merits potential and limits of Connectionism this book also illustrates current research programs and recent trends Connectionism also known as Neural Networks is an exciting new field which has brought together researchers from different areas such as artificial intelligence computer science cognitive science neuroscience physics and complex dynamics These researchers are applying the connectionist paradigm in an interdisciplinary way to the analysis and design of intelligent systems In this book researchers from the above mentioned fields not only report on their most recent research results but also describe Connectionism from the perspective of their own field looking at issues such as the effects and the utility of Connectionism for their field the potential and limitations of Connectionism can it be combined with other approaches **Information-Theoretic Aspects of Neural Networks** P. S. Neelakanta, 2020-09-23 Information theoretics vis a vis neural networks generally embodies parametric entities and conceptual bases pertinent to memory considerations and information storage information theoretic based cost functions and neurocybernetics and self organization Existing studies only sparsely cover the entropy and or cybernetic aspects of neural information Information Theoretic Aspects of Neural Networks cohesively explores this burgeoning discipline covering topics such as Shannon information and information dynamics neural complexity as an information processing system memory and information storage in the interconnected neural web extremum maximum and minimum information entropy neural network training non conventional statistical distance measures for neural network optimizations symmetric and asymmetric characteristics of information theoretic error metrics algorithmic complexity based representation of neural information theoretic parameters genetic algorithms versus neural information dynamics of neurocybernetics viewed in the information theoretic plane nonlinear information theoretic transfer function of the neural cellular units statistical mechanics neural networks and information theory semiotic framework of neural information processing and neural information flow fuzzy information and neural networks neural dynamics conceived through fuzzy information parameters neural information flow dynamics informatics of neural stochastic resonance Information Theoretic

Aspects of Neural Networks acts as an exceptional resource for engineers scientists and computer scientists working in the field of artificial neural networks as well as biologists applying the concepts of communication theory and protocols to the functioning of the brain The information in this book explores new avenues in the field and creates a common platform for analyzing the neural complex as well as artificial neural networks *A Computational Perspective on Visual Attention* John K. Tsotsos,2021-06-22 The derivation exposition and justification of the Selective Tuning model of vision and attention Although William James declared in 1890 Everyone knows what attention is today there are many different and sometimes opposing views on the subject This fragmented theoretical landscape may be because most of the theories and models of attention offer explanations in natural language or in a pictorial manner rather than providing a quantitative and unambiguous statement of the theory They focus on the manifestations of attention instead of its rationale In this book John Tsotsos develops a formal model of visual attention with the goal of providing a theoretical explanation for why humans and animals must have the capacity to attend He takes a unique approach to the theory using the full breadth of the language of computation rather than simply the language of mathematics as the formal means of description The result the Selective Tuning model of vision and attention explains attentive behavior in humans and provides a foundation for building computer systems that see with human like characteristics The overarching conclusion is that human vision is based on a general purpose processor that can be dynamically tuned to the task and the scene viewed on a moment by moment basis Tsotsos offers a comprehensive up to date overview of attention theories and models and a full description of the Selective Tuning model confining the formal elements to two chapters and two appendixes The text is accompanied by more than 100 illustrations in black and white and color additional color illustrations and movies are available on the book s Web site
